Introduction

Poor governance, both in general and within the transport sector in particular, has hampered the impact of EU-supported sectoral reforms. Analysis of the limited progress made over the past decade has served to highlight the lack of capacity or political will. However, those involved in the transport sector maintain that the reasons for slow progress are complex and deep-seated.

This handbook is earmarked for EU Delegation staff in SSA and is designed to help them to better address governance issues in the transport sector.

This guide is divided into **two volumes**:

- The first volume describes the **concepts and methodology** developed to optimally integrate governance into EU Delegation' portfolios.
- The second volume consists of a **toolbox** to be used according to (i) the forecast project size, (ii) the experience of users in the field, (iii) the degree of participation of local authorities and (iv) the available resources, including time and budgets. Eleven tools are available, together with standard terms of reference for any studies that will be carried out.

This is the second volume. It presents a set of eleven tools and standard terms of reference for use by consultants who may be brought in. The end point is an Action Plan, i.e. an Action Fiche for a project that will be financed by the EDF.

For more than ten years, interest in governance has prompted a rise in the number of analysis tools, developed by all the parties involved in development cooperation. Methods of approach vary, but the options proposed do not differ fundamentally. Further details can be found in the bibliography.

The eleven tools, and the sources of information on governance, apply a global analysis at the national level. The sectoral approach is still embryonic. The specifics of the transport sector, especially in terms of pressure to extract rent and institutional innovations, are not taken into consideration.

The methods and tools presented in this handbook therefore build on the tools that exist at a more general level, while introducing dimensions specific to the transport sector. The aim is to identify in advance lines of analysis and focus points using a generic framework common – to varying degrees – to the countries of SSA.

It has been assumed that the results of earlier, more general, analyses are available to each Delegation, whether carried out by the EU (as an analysis of the political economy in preparation for a programming cycle), by the ADB (governance profiles), the WB or other DPs (DFID or SIDA in particular).

Programming support

- **Tool A:** *Checklist* of the political economy of the country
- **Tool B:** *Checklist* (B1) and Matrix of sectoral governance (B2)
- **Tool C:** Analysis of the demand for and supply of governance (C1) and the Test of change ownership (C2)

Identification of the action plan

- **Tool D:** Analysis of the performances of the sector by mode
- **Tool E:** Analysis of corruption in the sector
- **Tool F:** Mapping of the actors (F1: Snapshot view of the actors, F2: Analysis of the relations between actors, and F3: Matrix of actors' sectoral interests)
- **Tool G:** Analysis of the political economy of the sector (G1: Analysis of the political economy of the sector, and G2: Evaluation of stakeholders) and Identification of drivers of change and institutional leeway (G3: Drivers of change, and G4: Institutional leeway)

Formulation of the action plan

- **Tool H:** Analysis of the performance of key institutions for the EU (H1: Analysis of the performance of key organisations, and H2: Diagram and targeting of efficient organisations)
- **Tool I:** Evaluation of the reactions of formal and informal organisations (I1: Framework of the relations of sectoral governance, and I2: Framework of the balance between formal and informal organisations)
- **Tool J:** Defining the monitoring indicators and the logical design framework of the Action Plan (J1: Matrix, and J3: Logical design framework of the Action Plan)

Implementation of the Action Plan

- **Tool K:** Monitoring the Action Plan by indicator

The EU has already produced reference documents that, on the one hand, define a framework for the approach to sectoral governance support (Tools and Methods Series, Reference Document No 4, *Analysis and consideration of governance in sectoral interventions*, 2008) and, on the other hand, propose tools for capacity development (Tools and Methods Series, Reference Document No 6, *Toolkit for Capacity Development*, 2010).

On this basis, this volume of the handbook proposes an approach specific to the transport sector, implementing the framework and completing the toolbox. This update takes account of the recent methodological reflections of the EU, particularly the diagnoses of the political

economy aspects of its interventions¹ in cooperation. It also includes tools recently developed by the World Bank. Each of these tools has been pre-formatted for the transport sector in SSA. They follow their sequencing in the EDF project cycle.

Finally, sample terms of reference (ToR) are proposed in the second chapter of this volume. This chapter enables users to draw up terms of reference according to the information required for their own particular situation, regardless of whether the sequence proposed in this handbook was followed.

¹ *Unsworth and Williams (2011).*

1. Presentation of the set of tools

There are eleven tools (from A to K).

1.1. Tool A: Checklist of the political economy of the country

Why this tool?

The *checklist* of the political economy of the country is designed to shed light on the way the country operates. Often, many details escape a technician in residence in a given country, either because he has just arrived, or because force of habit and the inertia of operational routines do not allow an overall view.

That is why, even if the tool may seem fairly simple, given the complexity of a local situation, the preliminary study should not be rushed. This tool sets out to assess the level of maturity of the country for governance reforms.

When and by whom can this tool be used?

It concerns those who have as their **entry point E1**. Ideally, the EUD will be in the process of drawing up the National Indicative Programme (NIP), but this is not a requirement.

Under the coordination of the Head of Cooperation, the Economy Section of the Delegation may conduct the economy study, with or without a consultant. Conversely, it should be transcribed into this tool jointly by the Economy and Infrastructure Sections of the Delegation.

How to use this tool

The tool presents a series of factors for which the following question must be answered: is it effective? If the factor is not at all effective, answer in the negative (N=no). A clear majority of “no” responses will point towards strategy 3 and the monitoring of the sector. However, if the proposed factor is effective or reasonably effective, the answer is affirmative (Y=yes). A majority of “yes” responses will be an invitation to continue through the toolbox to define a strategy (1 or 2). Observing the trend for each factor and area aims to mitigate or reinforce the respective scores.

The tool is indicated by an upper-case ‘A’. Each area has a number and each factor a lower-case letter. Thus, the factor “Heavy tax burden” is numbered ‘A1a’, as shown in the table below.

Thus, for a country such as Guinea-Bissau, say, it is not recommended that the Delegation proceed any further in its efforts to support governance. Conversely, for a country such as Cape

Verde or Mauritius, the chances of success of a governance support project are optimal. In this case, it is advisable to continue using this handbook. Between the two extremes, there is a wide variety of situations where use of this tool, combined with common sense, will help Delegations in their decision-making.

Context and details

In the absence of a complete study, governance profiles are available that were produced by the other DPs or the African Union. These profiles should be used as a starting point for either:

- a summary analysis internally on the basis of the *checklist* of questions from the EU's analysis of the political economy; this analysis may be conducted by the Economic Section and requires the collaboration of the political adviser, the Economic Section, the Governance Section and the Infrastructure Section. The Delegation's local staff will be an important source of information.

Or:

- use of a consultant, as part of what is mainly a desk-based mission (5 days) with a brief stay (3 days) in the Delegation. The list of questions from the political economic analysis (PEA) will serve as a guide. The approach will be comparative with neighbouring countries sharing the same institutional (and possibly structural) characteristics.

How much might it cost?

In the relatively unlikely scenario that there is no documentary basis for the analysis of governance, a consultant must be called in. In this case, this tool must be produced jointly with the full involvement of the Delegation, at least the Economic and Infrastructure Sections.

ToR are proposed in the second chapter of this volume to guide the user in his approach.

1.2. Tool B: Checklist and matrix of sectoral governance

Why this tool?

The *checklist* and the matrix of sectoral governance will help put the capacities and potential for development of the sector into perspective.

The infrastructure and transport services sector has many common points in the various countries of SSA, both in its organisation/regulation by the state, its operation by the system of patronage and the functioning of the markets (PW, engineering/inspection of works and transport). It is therefore possible to base the analysis and integration of governance in the sector in a generic framework by analysing deviations from the regional “norm” rather than

starting from scratch. This approach helps empower the delegations for the contextual and preliminary analyses and to reduce and standardise the results of analyses outsourced to teams of consultants.

Based on the main categories of key governance issues in the transport sector, the thematic entries for identifying the actions to be implemented are as follows:

Management of public finances; sectoral policy and programming	Distortion of the planning, programming and management of public finances
Capacity building and incentive development	Administrative problems, lack of public service spirit
Institutional restructuring and fight against corruption	Corruption in the management of the development and maintenance of infrastructures
Liberalisation and regulation of transport and public works markets	Anti-competitive agreements in the transport services, lack of regulation and rackets
Participation of users, monitoring of sectoral performances and communication	Fragmentation of the demand for governance and weak participation of users

When and by whom can this tool be used?

This tool is relevant to entry point E2 and to situations where the analysis follows from the use of tool A (entry E1).

Ideally, this tool should be used in the first stages of constructing the National Indicative Programme (NIP). However, it may be that, due to lack of time or resources during this brief programming period, the Infrastructure Section of a Delegation decides to move this analysis to the front of the NIP, ahead of the identification stage.

The Infrastructure Section can carry out this process with the assistance of the other sections and under the coordination of the Head of Cooperation. The final or intermediate outcome must be shared and validated internally by all sections. Other DPs involved in the sector or other stakeholders known for their independence from the system of patronage and/or clientelism may share their comments informally.

How to use this tool

Two complementary tools are proposed: (1) the *checklist* of sectoral governance, or tool B1, and (2) the matrix of sectoral governance, or tool B2. The former feeds the latter.

- **Checklist of sectoral governance, or tool B1**

The tool takes the form of a list of factors, grouped by field of affiliation. The user should check that all the information necessary to fill tool B2 is present.

Therefore a cross should be put next to each factor when the information necessary for the next stage exists. This information is often available on the Internet or from the other donors. It is not recommended to get involved in laborious and complex searches if this information is not readily available. With at least 75% of the requested information the user can proceed to tool B2. Of course, the less experience the EUD has in the area and the larger the envisaged project, the better it is to aim for closer to 100%.

Each factor is indicated by an upper-case 'B' (in reference to the tool). Each area has a number (1 to 11) and each factor a lower-case letter. Thus, the factor "Country in post-conflict situation..." is numbered 'B1a', as shown in the table below. It is possible to opt for external assistance (consultant) to consolidate all the information and create tool B2.

Once ready, proceed to the next tool: B2.

- **Matrix of sectoral governance, or tool B2**

Each factor in table B1 corresponds horizontally to one of the five key problems of the sector (described above) in table B2. It will also be broken down vertically in table B2 depending on the level of governance concerned: (i) macro-governance (political and sectoral policy framework, legislative and regulatory framework, etc.), (ii) meso-governance (distribution of responsibilities between institutions and relations between institutions; operation of construction transport markets etc.) and (iii) micro-governance (internal organisation of each institution, operation within a profession or corporation).

For example, the information B6a in table B1 will mainly concern the key problem "distortions of sectoral policy, programming and management of public finances" at the level of "macro-governance" in table B2. A simple assessment of whether the situation presents a minor, moderate or major deviation (below) in relation to the norm on the continent should be performed. Each type of deviation corresponds to one of the three strategies: (i) minor deviation = Strategy 1 or support for reform (Low or "l" in table B2); (ii) moderate = Strategy 2 or advocacy for reform (Moderate or "m" in the table B2), and (iii) major deviation = Strategy 3 or incubation of reform (high or "h" in the table B2).

Once table B2 has been filled in with the available information, the general trend will be evaluated. For example, a majority of "minor deviations" will point towards strategy 1, while a majority of "major deviations" will indicate strategy 3, etc. A balanced distribution between the

three strategies will favour strategy 2, etc. In all cases, common sense should be applied to interpret the results of the matrix.

If the result indicates strategy 3, it is strongly recommended to abandon the evaluation process and put in place a sectoral monitoring system.

If the result obtained points towards strategy 1 or 2, proceed straight to tool C.

Context and details

Creating this *checklist* of sectoral governance should not pose a problem for the Delegation. As a general rule, the vast majority of this information is available within the large body of literature on the sector for each country. Obviously, the situation of a small country such as São Tomé et Príncipe will not be as heavily documented as Senegal or Tanzania. The main limiting factor for the Delegation is the time available to check the availability and viability of the information. This is why this task may be outsourced.

It is important that at least 75% of matrix B is filled in and that the information is reliable. The large number of criteria (around 100) will allow wrong answers or unreliability to be smoothed out.

How much might it cost?

It is entirely possible that the Delegation is able to complete the *checklist* without external assistance. In this case, the additional cost would be zero. However, if, for one reason or another (often numerous given the daily operational obligations), the Delegation is unable to carry out this sectoral analysis, external assistance can be provided through consultants.

Conversely, where producing the matrix is concerned, it is suggested that a specialist consultant be hired to link the sectoral diagnoses to practice (and where applicable that of the other DPs). The matrix will be used to evaluate deviation from the SSA norm and therefore whether a commitment to supporting (or continuing to support) governance in the transport sector, or in a sub-sector, is appropriate. The hired consultant must have a mixed governance/transport economics with as broad experience as possible of land-based modes of transport, ports and the logistics chain.

The number of person-days and the duration of the mission will vary depending on the type of governance identified in the previous stage. If sectoral governance can be considered representative of the context of governance at national level, and has been stable for the past 5 years and relatively functional, the mobilisation of 10 person-days over one month is sufficient. Should this not be the case (governance that is dysfunctional, unstable, specific to the sector), the analysis should be extended and deepened. In states that are fragile or in a post-conflict situation, where the basis for analysing reconstruction is thin, the intervention may be reduced.

ToR are proposed in the second chapter of this volume to guide the user's approach.

1.3. Tool C: Analysis of sectoral governance supply and demand and the test of change ownership

Why this tool?

As previously, this instrument consists of two tools (C1 and C2). It is also designed to progress further into the analysis of the sector to refine the choice of strategy.

The first (C1) aims to measure the balance or imbalance between the demand for and the supply of (good) governance. Above all, it allows the demand for and supply of governance to be evaluated using simple questions to establish whether the answer indicates a strategy that is favourable, unfavourable or not at all favourable to sectoral reform.

The second (C2) is a matrix that establishes the effectiveness of the handling of the dynamics of reform by the partner for a sample of programmes and projects in the sector as a whole. It was developed on the basis of the summary table of the trajectories of reform presented in chapter 2. Based on the results of this analysis and those that precede it, the deliverable will make recommendations for the strategic directions of the EU's support to governance in the transport sector.

When and by whom can this tool be used?

Ideally, this tool is useful in the first stages of constructing the National Indicative Programme (NIP). However, it may be that, due to lack of time or resources during this brief programming period, the Delegation decides to move this analysis to the front of the NIP, ahead of the identification stage.

This tool is to be used under the coordination of the Head of Cooperation of the Delegation by the Infrastructure Section. The final or intermediate result must be shared and validated internally by all sections. Other DPs involved in the sector or stakeholders known for their independence of systems of patronage and/or clientelism may share their comments informally.

How to use this tool

Two complementary tools are proposed: (1) the evaluation of sectoral governance supply and demand (C1) and (2) the test of change ownership (C2).

- Evaluation of sectoral governance supply and demand

Tool C1 is fed by table B1, or indeed A for an entry in E1. It involves answering a series of questions classified by theme and corresponding either to the demand for or the supply of (good) governance. Questions must be answered “yes” or “no” depending on the information available in tools A and B1. This is why, for each group of questions, there will be several possible references from which to infer the answer. At the end, the number of “yes” responses should be added in each column. If the score obtained is in favour of strategy 2 or 3, strategy 2 must be followed for the Action Plan and subsequent tools.

If strategy 1 emerges, it is advisable to continue with tool C2 to confirm whether Strategy 1 is indeed the one that corresponds to the situation and not 2. This will avoid undertaking a series of numerous and costly studies, at the end of which a project emerges that has a potentially significant risk of bottlenecks in its “DNA”. You can never be too careful!

- Test of change ownership

Based on a representative (at least 5) sample of projects or programmes in the sector, a score should be assigned (between 1 and 5, where 1=low) to each line in the corresponding column. The addition of the scores in each column for all the projects evaluated will indicate whether the trend in the past was for projects to be on the initiative of the partner or the DPs and at what stage of the project cycle. A high score in the two left-hand columns would favour an ambitious strategy (strategy 1). Conversely, high scores in the right-hand columns will indicate a strong tendency for past projects or reforms to be initiated by DPs and would therefore lead towards strategy 2.

Once certain of the strategy to be adopted, all that remains is to follow the menu proposed for each one in the set of tools. Obviously, those with strategy 3 will go no further.

Context and details

These two tools are not absolutely reliable, and it certainly makes good sense to read all the answers, if only to obtain an overall picture of the situation.

Since the transport sector is characterised by low (if not non-existent) demand, most of the questions concern the latter. This should also bring about a reflection on the state of demand, to understand why it is weak or, conversely, strong and structured. The questions presented cover generic situations acceptable in the vast majority of countries of SSA. To be more precise, it is possible to delete or add them if the local characteristics so require.

For the ownership test, the sample must be relevant and sufficiently large to ensure the results are valid. Logically, the projects evaluated must be relatively recent. Should there not be enough projects to compile the sample, the result of the analysis will be negative, as this situation would suggest that the country is not accustomed to launching reforms or projects in the sector. Caution should be exercised when following strategy 2.

How much might it cost?

This tool should not necessarily require specific external aid. The sources of information are present in tool B, or indeed A (for entry in E1). However, if external aid was used to complete the previous tools, there is nothing to stop this instrument being included in the deliverables of the first mission, at no major additional cost.

In isolation, tool C would require the hiring of a consultant for an intervention of around 10 man/days over 1.5 months.

ToR are proposed in the second chapter of this volume to guide the user in his approach.

1.4. Tool D: Analysis of the performance of the transport sector by mode

Why this tool?

This stage is not specific to the definition of support to governance. Based on sectoral policy and its sub-sectoral components, it aims to evaluate: (i) the relevance of sectoral policy and the resources mobilised; (ii) the consistency of the underlying principles compared to the development of the policy framework in transport in SSA; (iii) the effectiveness of the implementation of sectoral policy, and (iv) the efficiency of the device, to establish a bridge to the subsequent stages.

The evaluation will concern the main modes, namely the road, rail and port sub-sectors. More precisely, it will be an overview of the three main modes of transport according to the evaluation indicators specific to them, grouped into homogeneous groups or axes of analysis.

The average results for each axis will feed a graphic, which will offer a “snapshot view of the sub-sector”.

When and by whom can this tool be used?

This tool is useful for beginning the analysis of the Project Identification Fiche (PIF). An initial analysis at the start of the process is recommended, to establish a base line. Then, every two or three years, it is advisable to update the instrument to monitor developments in the performance of the sector and sub-sectors.

Two options are possible when rolling out this exercise.

Firstly, this instrument may be formalised through the Sectoral Table under the leadership of the competent sectoral authorities with the support of the sector's DPs. If the Sectoral Table does not exist or does not operate satisfactorily to put in place a recurrent instrument such as this, the Sectoral Group may manage its introduction, especially if the EU is the leader of the DPs within the Group.

Otherwise, the Infrastructure Section of the Delegation, with the assistance of the other sections, can carry out this process. The final or intermediate result must be shared and validated internally by all sections. Other DPs involved in the sector through the Sectoral Group (if one exists) or stakeholders known for their autonomy from the system of patronage/clientelism may share their comments informally.

For entry into E1 or E2, this tool will only be developed for strategy 1.

For entry into E3, choose the strategy directly between 1 or 2 depending on the institutional and operational context, the EUD's experience (personal or within the Delegation), etc. Most Delegations should probably use this entry point.

The government has been interested by sectoral reforms or previous reforms were successful. However, the large size of the envisaged project and/or the information available and/or the lack of experience prompt certain reservations that will only be satisfied after a specific study of the sector. In this case, it is advisable to opt directly for strategy 1, following the order proposed in this guide.

Nevertheless, if, at the end of this series of studies, it turns out that the project cannot be very important because a certain number of risks remain, in the following stage (Action Fiche – AF) preference will be given to strategy 2 and the tools that accompany it. If the financial resources, for the studies and the project, are not in line with the potential needs, preference will be given to strategy 2, similarly in the next stage for drafting the Action Fiche.

How to use this tool

This tool consists of three analytical grids for the sector, one for each sub-sector: road, rail and port, and a graphic allowing the situation for each mode to be summarised while making it easier to track its development over time.

The three grids will help provide an exhaustive evaluation of each mode according to classic performance indicators grouped into homogeneous segments or axes (growth, effectiveness, practicability, etc.) specific to the mode in question.

Each indicator will be given a score from 0 to 4 (0 corresponding to a very bad situation and 4 to an excellent situation). An average score will be determined for each axis or segment of analysis.

These average scores for the axes will feed the following graphic, which will take the form of a “spider’s web”. The larger the area covered by the web, the greater the performance of the mode. Conversely, a small area will indicate a low-performance mode. This will therefore provide an overall snapshot view of the performance of the mode, but also a picture per segment of the performance or counter-performance. In this way, technical priorities will be established for investments, in addition to the institutional priorities associated with governance.

Context and details

In essence, the analysis concerns the performance of the sub-sectors and not their general impact on other sectors (health, agriculture, economic development, etc.) or their contribution (or non-contribution) to development.

It is not advisable to compare modes, as the axes of evaluation vary from one mode to another.

How much might it cost?

This task will be outsourced. It requires a team of at least two consultants combining the profiles of transport economist and institutional expert. The volume of person-days and the duration will depend on the pre-existence of sectoral support from the EU or another donor, and on the level of economic development in the country (and therefore the development of modes of transport and logistical functions).

ToR are proposed in the second chapter of this volume to guide the user in his approach.

Options	Manager	Execution	Budget €k	Mission person- days	Duration in weeks	Deliverable

Axis 4	0.5
Axis 5	3
Axis 6	2.8

1.5. Tool E: Analysis of corruption in the sector

Why this tool?

Corruption prevails in the transport sector in the management of works contracts, the management of concessions and the management of the issue of transport papers and documents.

The first represents the most significant financial problem and shortens the service life of structures. The second inhibits the potential leverage effect of public funds from the private capital market, and therefore the future adaptation of transport infrastructures to the challenges of the future. The third involves petty corruption and will therefore remain beyond the scope of EU support: it does not require specific analysis.

This tool focuses mainly on the first type of corruption: public procurement.

When and by whom can this tool be used?

This tool is useful while drawing up the PIF and for a strategy 1 from an entry into E1, E2 or E3.

Two options are available to the Delegation when rolling out this exercise.

Firstly, this instrument may be formalised through the Sectoral Table under the leadership of the competent sectoral authorities with the support of the sector's DPs. If the Sectoral Table does not exist or does not operate satisfactorily to put in place a recurrent instrument such as this, the Sectoral Group may manage its introduction, especially if the EU is the leader of the DPs within the Group.

Otherwise, the Infrastructure Section of the Delegation, with the assistance of the other sections, can carry out this process. The final or intermediate result must be shared and validated internally by all sections. Other DPs involved in the sector through the Sectoral Group (if one exists) or stakeholders known for their autonomy from the system of patronage/clientelism may share their comments informally.

It is possible and indeed recommended, to work in partnership with other Sectoral Tables that habitually deal with the question of where, in the majority of cases, the EU is present and assumes responsibilities (leader of the DPs) such as those on the management of public finances or governance/modernisation of the administration.

How to use this tool

Besides the general framework, tool E is structured to reflect the major stages of the cycle of a call for tender:

- Preparation of the TD: Evaluation of needs, Programming and budgeting, Definition of needs, Choice of procedure;
- The call for tender: Publication / invitation, Evaluation of offers, Award of the contract;
- Management of the contract: Day-to-day administration of the contract, Payment and service order.

Based on a sample of a dozen projects for new constructions, rehabilitations or periodic maintenance operations (paved roads and dirt roads), at each stage the analysis will measure the presence of alerts, among those offered, or others depending on the specific characteristics of the sector in the country.

Example of alerts to look out for:

- A time lapse of more than 7 months between the opening of the envelopes and the signing of the contract;
- Increase in the cost of the project of more than 20% during execution;
- Increase in the duration of the project of more than 30%;
- Value of the contract exceeds the initial estimate by more than 20%;
- More than half the companies that bought the dossier do not submit an offer;
- 20% and more of the pre-selected companies do not submit an offer;
- Difference between the chosen offer and the next one less than 2%;
- The chosen offer was not the lowest bid when the envelopes were opened;
- Only one or two submissions;
- Costs per km for similar work is above the 75th percentile;
- Unit cost of one type of operation is above the 75th percentile, especially those that are difficult to control.

The presence of alerts will indicate whether the potential risk has become a reality when at least 2 projects out of 10 are concerned. In this case, simply (i) refer to the corresponding possible actions, (ii) choose the most relevant in relation to the established situation, and (iii) assess which is the best instrument or vector to develop the envisaged action.

Context and details

Concession projects or other forms of public-private partnership may be included in the sample. However, they must also be analysed to ensure compliance with the mutual contractual obligations based on the following indicators: (i) regularity of payment of fees by the concessionaire, and (ii) percentage of licensor's obligations actually fulfilled.

Where appropriate, the approach could include a survey on corruption in the sector, with a sample of users (maximum 50 people). The questions will be prepared on the basis of the following topics:

- The government's priorities for investment in the transport sector are appropriate;
- The public is correctly informed of expenditure in the sector;
- New entrants on the market have reasonable chances of obtaining contracts (works, concessions, etc.);
- The main contracts are awarded on the basis of the best price/quality ratio or the lowest bid;
- It is now rare to have to pay bribes to speed up administrative procedures (issue of permits etc.);
- Cases of presumed corruption are usually subject to investigation and lead to actual convictions;
- If officials do not follow rules and procedures, they are punished;
- Complaints and claims from the public are generally handled properly.

A scale of 1 to 5 will be offered to each person questioned and will confirm or refute the findings drawn from the sample of 10 projects.

How much might it cost?

This task may be outsourced. It requires a consultant with an engineer's or economist's profile for 10 man/days over 2 weeks.

ToR are proposed in the second chapter of this volume to guide the user's approach.

1.6. Tool F: Mapping of the stakeholders

Why this tool?

This tool aims to clarify the priorities of reform at sectoral or sub-sectoral level by helping users identify the main public, private and civil-society organisations that play a major role in terms of demand, administration, monitoring, service provision and responsibility in relation to a body of work considered essential for present and future political outcomes in a sector.

When and by whom can this tool be used?

This tool is useful when drawing up the PIF. It concerns all those who, having entered in E1, E2 or E3, are pursuing strategies 1 or 2. The majority will use it.

Two options are available to the Delegation when rolling out this exercise.

Firstly, this instrument may be formalised through the Sectoral Table under the leadership of the competent sectoral authorities with the support of the sector's DPs. If the Sectoral Table does not exist or does not operate satisfactorily to put in place a recurrent instrument such as this, the Sectoral Group may manage its introduction, especially if the EU is the leader of the DPs within the Group.

Otherwise, the Infrastructure Section of the Delegation, with the assistance of the other sections, can carry out this process. The final or intermediate result must be shared and validated internally by all sections. Other DPs involved in the sector through the Sectoral Group (if one exists) or stakeholders known for their autonomy from the system of patronage/clientelism may share their comments informally.

How to use this tool

This tool consists of a series of three successive instruments: (1) the snapshot view of the stakeholders (identification), or F1; (2) analysis of the relations between the stakeholders (influence flow), or F2, and (3) the matrix of the stakeholders' sectoral interests, or F3.

The first is designed to allow the principal organisations to be identified that have or should have a "major role" in the sector in producing general sectoral effects. The purpose of the

second is to characterise the relations between two stakeholders. Finally, the aim of the third is to gain a better understanding of the logic of each stakeholders, in the form of a matrix.

Context and details

This tool allows the organisational limits of the sector or sub-sector to be identified when a reform is envisaged. Different categories of organisation are taken into consideration (central agencies, regulatory bodies, political system and civil society organisations representing the voice and demand for services, etc.).

This tool is based on the assumption that sectors must be understood in a holistic and comprehensive manner, as relations within the sector and with external factors are critical to the dynamics of that sector. Consequently, policies often have to adopt a broad view (which must be reflected in specific sub-sectoral policies). However, when it comes to making policies operational in the form of programmes (as is the case for reforms), to ensure that they are manageable, it is often necessary to evolve measures in the form of sub-programmes that can often benefit from clear institutional anchorage.

This tool allows the study of sectoral governance, which overall encompasses the “rules of the game” of the sector: Who decides on the priorities? How are resources distributed? How is authority exercised? Who is accountable to whom, formally or informally? Governance and responsibility are therefore opposite sides of the same coin: those who govern must be able to hold those governed to account. In liberal democracies, elections are supposed to be the ultimate mechanism by which those who govern are responsible to the electorate; in single-party systems, the party leaders are held to be responsible to the members of the party. In a company, a board of directors demands that executives are responsible to it. In informal networks of favouritism, clients are responsible to patrons, but the latter may also be partly responsible to clients.

By focusing solely on the key stakeholders, this tool makes it possible to simplify what is probably a complex web of stakeholders and relationships.

How much might it cost?

This tool was produced internally within the Delegation, based on a monthly press survey and dialogue with contacts at the administration of public works and transport.

If there is a need to outsource it, this must be configured as a half-yearly long-term intervention by an expert in transport policy for a period of one week over three years.

ToR are proposed in the second chapter of this volume to guide the user’s approach.

Executed externally	Infrastructure Section	External	30	30	156	Note (max. 20 pages)

Presentation of tool F

Tool F1: Snapshot view of the stakeholders

The categories of stakeholders to be identified and characterised in the operation of the transport sector are as follows:

Main stakeholders	Resistance to change	Capacity to initiate change
Family elites	<p>Their influence is directly proportional to the size of the rent extracted or the political influence at stake.</p> <p>Certain elites may join forces or, conversely, fight, or sometimes ignore each other (parallel networks). Often for reasons of global power allowing control over other, more important, sources of income.</p>	<p>Certain elites have an interest in the modernisation of the country or the sector because the increase in the base and the economic dynamism allows earnings significantly greater than the status quo.</p> <p>Increases in leverage effects and economies of scale are the best allies of reform. Unfortunately, it is not a question of making the networks disappear, but of modernising them at the same time as the sector. It is therefore more a matter of modernising the method of extracting rents or, ideally, of stopping rent extraction in a given sector (in this case transport) to encourage a greater opportunity for extraction in another sector that needs an effective transport sector to grow sustainably.</p>
MPs	<p>Their influence is limited by the lack of operating budget and cooperation by the executive.</p> <p>In many cases, they have direct or indirect interests in extracting rent from the transport sector (monopoly on a segment of the market or share linked to investments in informal urban transport).</p>	<p>They can modify the legislative and possibly the regulatory framework (if supported by the government and the administration for the adoption of regulatory texts).</p> <p>They are able to exercise control over expenditure, influence sectoral policy and launch parliamentary</p>

Governance in the Transport Sector

Methodology and tools for integrating governance into support for the transport sector in Sub-Saharan Africa
Volume 2 – Toolbox

Main stakeholders	Resistance to change	Capacity to initiate change
		<p>inquiries.</p> <p>Beyond their legislative power, they can pass on the demand for governance expressed by voters.</p>
Judges	<p>Recourse to the courts to apply business or administrative law is non-existent. The courts are subject to the executive and are corrupt.</p> <p>Judges have connections with the political power and the elites that handicap the impartial application of the law.</p> <p>The courts lack their own resources, technical competences and administrative capacity.</p>	<p>With greater independence and resources less dependent on the arbitration of the executive, it is their responsibility to ensure the legality of public policies and to penalise illegal practices within the executive.</p>
Political parties	<p>Political parties are largely a vehicle for competition for access to rents within the elite. They are not structured or institutionalised, and do not have regulatory financing arrangements. They are not able to raise the demand for governance and users' concerns about the cost of transport. The rents extracted from the sector fuels competition for access to power.</p>	<p>Structured and institutionalised political parties, less dependent on pressure groups for their financing, must be the forum for negotiating and aggregating society's divergent interests (resolution of impasses in collective action).</p> <p>They can raise the demand for better governance in transport to influence the price paid by users.</p>
Central government (first and second line)	<p>The officials of central government have professional skills and a good understanding of donors' expectations.</p> <p>They are usually co-opted by the political power brokers and also develop their own strategies of corruption by exploiting the weakness of formal rules in informal networks of dependencies, in the context of the impunity conferred by the failure of the legal system.</p> <p>There is a high degree of permeability between high public office and political parties, until administrative operations are politicised.</p>	<p>Central officials are the interface between the reality on the ground and the institutional evaluation models for the management of the transport sector. They are best able to locate realistic institutional leeway for better governance, based on the demand for governance raised by the political parties.</p>
Territorial authorities	<p>Their ability to develop different policies is limited by the powers conferred upon them by the constitution and the limited resources to which they have access, by levy and more usually by transfer.</p> <p>Their legitimacy is often limited by the their links either with the central power or with the regional/local traditional</p>	<p>They represent a potential for the development of different approaches to the management of infrastructures and transport services, particularly around the issue of coordination of transport and compensation for public service obligations.</p>

Governance in the Transport Sector

Methodology and tools for integrating governance into support for the transport sector in Sub-Saharan Africa
Volume 2 – Toolbox

Main stakeholders	Resistance to change	Capacity to initiate change
	authorities.	
Public companies	<p>They quickly collapse in the transport sector, particularly in urban and rail transport, because of the lack of regulation of competition between modes of transport or with the informal sector, social tariffs without compensation, and mismanagement of fleets and staff.</p> <p>Public works companies develop similar deficiencies, linked to an excess of supervision.</p>	<p>They do not have the authority to use public money while global governance does not yet have recourse to equitable law and administrative and criminal responsibility for all those in the sector.</p>
Private companies	<p>Transport is the economic activity most accessible to small investors, and therefore in the absence of regulation, to competition and informal activities. Transport activities are the primary outlet for rents extracted by the elite, who use their connections to limit access to the market or segment the market to accentuate oligopolies.</p> <p>In return, the sector helps finance competition between the patronage networks for central or decentralised political power.</p> <p>Road transport allows the rapid accumulation of capital and the gradual rise of the urban taxi to international large-capacity carrier. The large proportion of own-account transport helps disrupt the functioning of competition but is an appropriate response to the informal nature of the business.</p> <p>The development of corporatism (road, dockers, railway) and the maintenance of State monopolies (aviation, ports) affect transport prices.</p> <p>Private public works companies generally lack the qualifications and access to long-term financial resources. Their evolution is hampered by the corruption prevalent in public procurement.</p>	<p>Private companies, placed in a regulated competitive framework based on an effective implementation of business law by the courts, are able to provide transport services under affordable conditions for the demand. The public service obligations and their efficient compensation by the State can extend the routes to reach the non-profitable demand.</p> <p>The same general logic applies to public works companies: regulated competition and independent control tasks for large projects; multiannual maintenance contracts for small businesses, with access to sites of greater complexity following certification by the administration.</p>
Traditional authorities	They have a priori little effect on the transport business.	
Media	Transport is a recurrent preoccupation in the media, both for traffic problems and prices or the useful life of road investments. Freedom of expression	The stories in the media about the difficulties of transport users and the problems of sectoral governance help put pressure on the system of

	<p>varies considerably from country to country.</p> <p>Presumptions of corruption in the sector are frequently reported, usually without being followed up due to systemic failures. The media are faced with a lack of transparency of the systems in place.</p> <p>There is often a degree of self-censorship in the press, even when it has a certain freedom.</p>	sector management.
Civil society organisations	<p>Their influence depends on the legal framework in which they evolve, their roots in society, their level of own resources and their ties with donors.</p> <p>They are virtually absent in the transport sector, mainly due to being locked out and to the opacity of decision-making and control processes. The ability to mobilise militant and financial support is also weakened by the lack of a clear alternative. The only divide exploited is the rural service against the rest of the sector.</p>	Civil society organisations have a parallel role to that of political parties to raise the demand for better governance in the sector, based on alternative public policies and greater integration in the decision-making and control chain.
External factors, including donors	<p>Donors in countries dependent on international aid have pushed for chain reforms in the transport sector based on similar models. Their influence on transport policies and the institutional framework is confined to the phases prior to the signing of agreements and to institutional formality.</p> <p>The predominance of patronage and clientelism has been restored after the event in most cases. External stakeholders are often unable to create ownership of reforms, except for an accidental conjunction of interests.</p>	<p>External stakeholders have the potential to channel demand for better governance in the transport sector, particularly by proposing institutional models to adapt the current collective decision-making capacity.</p> <p>This contribution will be all the more sustainable if it extends the existing system or manages the period of transition.</p>
Other		

Tool F2: Analysis of the relations between stakeholders

It is recommended that a first table be completed to characterise the bilateral relations between two given stakeholders (example: MPs/Judges or Judges/Political Parties etc.). This same table could clearly indicate potential alliances for reform or the status quo. A policy in bold or italics could point to a strong or secondary relationship.

Governance in the Transport Sector

Methodology and tools for integrating governance into support for the transport sector in Sub-Saharan Africa
Volume 2 – Toolbox

A second table could use colours to indicate stakeholders belonging to the same group (for example the stakeholders following the same alliance or belonging to a network could be coloured orange). An stakeholders may belong to several networks. Another colour could indicate who is a champion, a reformer or a conservative, now or in the future. If necessary, several tables can be completed, if the complexity of the sector's situation and the large number of colours make the initial table difficult to read.

1.7. Tool G: Analysis of the political economy of the sector and identification of drivers of change and institutional leeway

Why this tool?

The analysis of the political economy of the sector aims to improve the realism and relevance of the ambitions and interventions of sectoral governance. It sets out to swiftly review the main factors linked to the inter-sectoral context, which are more often dependant on more general politico-economic factors, capable of encouraging and/or curbing capacities. The performance of sectoral organisations and the chances of reform, the reluctance to reform and change on the part of key stakeholders will be discussed.

The identification of drivers of change and institutional leeway is designed to allow the user to focus on ways of strengthening support for change and overcome resistance to it and to develop realistic reforms for the politico-economic context and the positions of stakeholders. This tool aims to guide the choice of stakeholders who can bring about change or reform and those who are against it, but also those who are undecided, who could become allies after a specific strategy. These three groups are not homogeneous, and it is worth knowing whether an ally or enemy of reform is powerful (significant resources or influence) or not.

This makes it possible to better target those stakeholders on whom one can rely, and to know who will be the drivers of change. This approach should also help establish how someone who is powerful and undecided could become an ally, or better still, how a declared enemy of reform could become undecided, or even a potential ally, if things were to change in one direction or another.

The results obtained by analysing the political economy of the sector (evaluation of stakeholders) will feed this tool which consists of two diagrams.

When and by whom can this tool be used?

This tool is useful while implementing the PIF. It will concern all those who, having entered in E1, E2 or E3, are following strategies 1 or 2, i.e. the large majority.

Two options are available to the Delegation for the rollout of this exercise.

Firstly, this tool may be formalised through the Sectoral Table under the leadership of the competent sectoral authorities with the support of the sector's DPs. If the Sectoral Table does not exist or does not operate satisfactorily to put in place a recurrent tool such as this, the Sectoral Group may manage its introduction, especially if the EU is the leader of the DPs within the Group.

Otherwise, the Infrastructure Section of the Delegation, with the assistance of the other sections, can carry out this process. The final or intermediate result must be shared and validated internally by all sections. Other DPs involved in the sector through the Sectoral Group (if one exists) or stakeholders known for their autonomy from the system of patronage/clientelism may share their comments informally.

How to use this tool

To **evaluate the political economy of the transport sector**, begin by creating two analytical tables:

- The table analysing the institutional and politico-economic context (or tool G1) allows the institutional and economic factors that determine sectoral performance to be identified;
- The table evaluating the stakeholders (or tool G2). This table invites the user to study the possible stakeholders, their interests and their resources. It provides a detailed analysis.

The information required for these tables may be drawn from personal knowledge, key informers and specialised studies. These tools can be used individually or collectively (workshops with or without the involvement of a consultant). They can be used to summarise the results of a thorough analysis or to highlight the need for further analysis.

Tool G1 is a checklist allowing the characteristic economic and institutional factors capable of influencing the chances of success of reform to be evaluated, across all sub-sectors. However, it is important not to limit the discussion: it is possible that factors that do not appear on the checklist should be taken into consideration. This checklist allows a score to be assigned: the higher the average, the greater the chance of the context not favouring sectoral reforms.

Tool G2 is a table consisting of five columns and as many rows as are necessary to deal with all the key stakeholders. These may be organisations (for example the Ministry of Finance, employers' associations), but this level of generalisation is often too limited. The analysis should extend to relevant people/positions or to small groups (for example to "MPs of the majority open to reform" or "influential group within a ministry"). This table proposes several groups of stakeholders that may be relevant to an approach to the transport sector, but these groups are purely indicative and are only mentioned here to encourage a broad discussion of potentially important stakeholders. The map of stakeholders is proposed by tool F.

The method for evaluating each column is as follows:

- The interests at stake. Why are the stakeholders interested in reform? What interests are they pursuing, what objectives are they trying to achieve? It should be noted that most stakeholders are likely to be pursuing several contradictory interests. At the outset, the interests mapped may cover what is globally at stake for the stakeholders within the political area of sectoral reform. Once the objectives of the reform have been specified, the support or opposition of the stakeholders to the change may evolve and require re-evaluation. The analysis of stakeholders' interests may be summarised using a 7 point scale (between -3

and +3): -3 if the interests (or importance of the issue) are strongly against reform, -2 if the interests (or importance of the issue) are moderately against reform, -1 if the interests (or importance of the issue) are somewhat unfavourable, 0 if the interests (or importance of the issue) are neutral, +1 for an interest (or importance of the issue) that is slightly pro-reform, +2 for an interest (or importance of the issue) moderately pro-reform, and +3 for a strong interest (or importance of the issue) that is pro-reform.

- Importance or weight of the issue. The stakeholders may be interested in the effects of the processes of change and possess considerable resources, but give the issue a higher or lower importance and therefore be more or less preoccupied by the issue of commitment to reform. The purpose of this column is to indicate the importance assigned to the issue by a stakeholder, still using a 7 point scale (between -3 and +3).
- Average score per stakeholder. This score corresponds to the average of the interests, and of the importance assigned to the issue for each stakeholder. Multiplying the scores assigned in each of the other columns gives a figure between +6 (considerable interest and high importance given to reform), 0 (the organisation is not really a stakeholder) and -6 (considerable interest and high importance given to not implementing reform). The score for all stakeholders then gives a rough idea of the general trend (for or against reform) and the likely levels of controversy. For example, high scores both for and against reform would indicate probable high levels of conflict/controversy.
- Resources/power of influence. The resources of influence include formal authority (a first secretary can give orders to his subordinates), formal rights (MPs can vote) and formal access (to a ministry, to the roads department, etc.). The resources also include informal networks, alliances and patron-client relations (around a political party, an ethical group of a “network of alumni”). Knowing who knows whom, why and how, may be vital to understanding the spheres of influence. The power to influence relating to stakeholders can be summarised on a 4-point scale (between 0 and 3): 0 equates to an institution without power or resources, +1 for reduced power, +2 for moderate power and +3 for important or strong power. Stakeholders without resources would effectively not be interested (0) and should therefore not appear in an analysis of the current situation, but they could become important in the future if their influence grew in one way or another.
- Overall balance. An organisation with a first score of -6 and a second of +3 would be strongly against reform and have a strong power to influence. Conversely, an institution with a first score of +6 and a second of +3 would be classified as being a potential ally with a strong influence to push reform forward. The overall balance will be used in tool J (identification of drivers of change).

Two diagrams will then be constructed, fed by tool G2.

The **first diagram (tool G3)** is the segmentation of the institutional landscape or stakeholders of the sector (or sub-sector) into three groups: (i) the supporters, (ii) the undecided, and (iii) those reluctant to reform. Simply insert the result obtained for each stakeholder concerning the interests at stake and the importance of the issue of reform, which must be between -6 and +6:

- A result between -6 and -2 will indicate an organisation hostile to reform. It is advisable to know whether this hostility could change depending on the content of the reform;
- A result between -2 and +2 will point to an undecided stakeholder. It is necessary to know whether this indecision could change depending on the content of the reform;
- A result between +2 and +6 will concern an institution in favour of reform. In this case, clarify whether this interest could change depending on the content of the reform.

The **second diagram (tool G4)** segments these three groups according to their level of resource or influence (power). Thus, it will be possible to know the genuine drivers of change: who the stakeholders are and how to get their support for the reform. It will also be possible to know whether these drivers are powerful or not, and how, as far as possible, to have them move from one group to another: this is institutional leeway.

For that, the score from the last column of tool G2 should be taken and three segments obtained for each group: (1) the very influential (score between +3 and +2); (2) the moderately influential (score between +2 and +1) and (3) the not influential (score between +1 and 0).

Context and details

These tools highlight the way the capacity of the main sectoral organisations to perform key functions is influenced positively or negatively by general economic and institutional factors at play beyond the confines of the sector and by the interests and power of stakeholders. They are therefore based both on factors (tool G1) and on the different stakeholders (tools G2, G3 and G4). These tools help answer the following questions: Which contextual factors explain the situation of existing capacities? Which contextual factors promote or inhibit change? Who has an interest in the *status quo* and who has an interest in change?

These tools enable the user to map the main factors and stakeholders who will influence the success of any process of change. Without a favourable environment and without the active support and commitment of the principal stakeholders, the reforms will fail. If influential stakeholders are opposed to the reforms, be it actively or passively, they will not work.

Attitudes to change are not fixed. The scheme resulting from the use of this tool is likely to change over time, and it is possible to influence the situation. If the scheme is established as part of a participatory process, it is probable that the participants have different perceptions of the interests of the stakeholders.

This tool enables a dialogue on the inclination for reforms of people who have interests and can make themselves heard or have power in relation to reform. Their goodwill is obviously influenced by the objectives and their scope.

These tools are intended to represent the situation as it is and not as it should be.

Analysis of the economy and stakeholders is not an exact science. Although most stakeholders have an idea of the economic factors and legitimate reasons to be for or against change, it is possible that the analysis of these issues is challenged and subject to controversy. Analysis of the economy and stakeholders also risks becoming uninteresting and superficial, especially if it is carried out over a short period in a workshop. In a sector, the key stakeholders intervening at a high level often have a tacit, but highly nuanced, analysis of the situation and are likely to find that it is not in their interest to share this analysis with others.

The resources of influence include formal authority (a first secretary can give orders to his subordinates), formal rights (MPs can vote) and formal access (to a ministry, to the ports department, etc.). The resources also include informal networks, alliances and patron-client relations (around a political party, an ethical group of a “network of alumni”). Knowing who knows whom, why and how, may be vital to understanding the logic of influence.

How much might it cost?

This task will preferably be outsourced. It requires a team of at least two consultants combining the profiles of an expert in the analysis of political economy (if possible of transport) and an expert in transport policy. The number of person-days and the duration will depend on the pre-existence of sectoral support from the EU or another donor and the level of economic development of the country (and thus the development of modes of transport and logistics functions).

ToR are proposed in the second chapter of this volume to guide the user in his approach.

Options	Manager	Execution	Budget €k	Mission person- days	Duration in weeks	Deliverable
Analyse the political economy of the sector and modes of transport						
Pre-existence of sectoral support	Infrastructure Section	External	10	10	0	Report (max. 50 pages)
Emerging country	Infrastructure Section	External	30	30	8	Report (max. 50 pages)
Low-income country	Infrastructure Section	External	20	20	0	Report (max. 50 pages)

Presentation of tool G

Tool G1: Table analysing the political economy of the sector

Area	Question to be evaluated	Yes (score 1)	A little (score 2)	No (score 3)	Consequence for the reform of the sector
Overall context influencing the drafting of sectoral policies / mode	Are sectoral policies (mode) supported by the government?				
	Are sectoral policies (mode) supported by the Parliament?				
	Are sectoral policies (mode) supported by the local elected officials?				
	Are sectoral policies (mode) supported by the Ministry of Finance?				
	Are sectoral policies (mode) supported by the ministry responsible for the sector?				
	Do political parties follow the interests of the sector (mode)?				
	Do sectoral policies (mode) define the strategies of the public institutions of the sector (mode)?				
	Do sectoral policies (mode) direct the work of officials?				
	Does the failure to respect sectoral policies (mode) have political consequences?				
	Are sectoral policies and legislation in the sector (mode) systematically monitored?				
Sectoral resources (mode), mechanisms of budgetary allocation and management of public finances	Is the budgetary process determined by sectoral policies (mode)?				
	Is the budget executed in accordance with the programming?				
	Is routine expenditure adequate (staff and operation)?				
	Is the investment budget adequate in relation to projects				

Governance in the Transport Sector

Methodology and tools for integrating governance into support for the transport sector in Sub-Saharan Africa
Volume 2 – Toolbox

	and programmes?				
	Are a significant number of investments made out of budget?				
	Does the Treasury quickly make funds available for investments, operation and salaries?				
	Are financial transfers transparent?				
Factors influencing organisational capacities	Are there performance incentives (material, financial) in the public sector of the sector (mode)?				
	Are the incentives sufficient?				
	Do the dynamics and competences of staff relate to the sectoral objectives (mode)?				
	Is employment in the public sector characterised by a lack of transparency (favouritism, contractual, etc.)?				
	Does the civil service follow a logic based on performance; is there a culture of performance / innovation?				
	Do the principal institutions (so-called first-line) have sufficient resources and autonomy to complete their missions?				
	Does the management style of these institutions allow staff to concentrate on their main tasks and take initiatives?				
Implementation of monitoring and responsibilities	Are supervisions and audits effective?				
	Are the recommendations of supervisions and audits applied?				
	Do audits certify the quality of the structure, goods or service received?				
	Does Parliament carry out regular and effective monitoring?				

Governance in the Transport Sector

Methodology and tools for integrating governance into support for the transport sector in Sub-Saharan Africa
Volume 2 – Toolbox

	Does the Court of Auditors or any other equivalent body carry out regular and effective monitoring?				
	Is external control effective and does it help promote adjustments in practices?				
	Are the results of external controls transparent and easily accessible?				
	Is civil society involved in managing the sector?				
	Do local elected officials exercise power of control and supervision?				
	Are users (excluding professional drivers, for example) involved in managing the sector (mode)?				
	Are users' associations represented and do they possess genuine powers of control?				
	Do the public stakeholders of the sector (mode) take users' grievances into consideration?				
	Can the professional associations of the sector (shippers, freight agents, taxis, etc.) express their grievances?				
	Are the professional associations of the sector (shippers, freight agents, taxis, etc.) representative, and is there no monopoly or exclusivity?				
Network operation and relations between stakeholders (including DPs)	Is there a process of formal or informal sectoral dialogue for drafting and implementing sectoral policies (modes)?				
	Are the sectoral table and sectoral group effective?				
	Do the public institutions cooperate easily?				
	Do the DPs have a passive role

Source: Reference document No 6 – Toolkit for Capacity Development, EU, 2010.

- Score as -3 if vested interests are strongly against reform or the issue is unimportant, -2 if vested interests are moderately against reform or the issue is of moderate importance, -1 if vested interests are somewhat unfavourable or the issue is of slight importance, 0 if vested interests (or importance of the issue) are neutral, +1 if vested interests are slightly pro-reform or the issue is somewhat important, +2 if vested interests are moderately pro-reform or the issue is of moderate importance, and +3 for strong interest in reform or an issue that is great importance.
- A score of -6 equates to a stakeholder strongly against reform because of strong interests at stake and which makes it a very important issue, whereas an organisation with +6 will have interests strongly in favour of reform and it is a key issue for it. The results between -6 and -2 (reluctance for reform) should be put in red; the scores between -2 and +2 (undecided) in blue and the scores from +2 to +6 (support for reform) in green.

Governance in the Transport Sector

Methodology and tools for integrating governance into support for the transport sector in Sub-Saharan Africa
Volume 2 – Toolbox

- 0 equates to an institution without power or resources, +1 for a reduced power, +2 for moderate power and +3 for important or strong power. An organisation with a first score of -6 and a second of +3 would be strongly against reform and have strong influence. Conversely, an institution with a first score of +6 and a second of +3 would be classed as being a potential ally, able to push reform forward.

Tool G3: The drivers of change

The results of the findings of the political economy of the sector will be used to establish a targeting of stakeholders to assign them to three distinct segments: (i) those resistant to reform, (ii) those who are undecided, and (iii) those who support reform or are allies.

Inspired by Reference document No 6 – Toolkit for Capacity Development, EU, 2010.

Tool G4: Institutional leeway

A second segmentation is designed to allow targeting based on the capacity of stakeholders to mobilise resources or their own power to influence. Thus, a large group of “resistants” with little power or influence will only represent a moderate danger to sectoral reform. Conversely, a large group of “supporters” with considerable resources is an excellent signal to initiate ambitious reform. Similarly, it is worth rallying a very influential group of “undecideds” to the cause of reform.

Source: Reference document No 6 – Toolkit for Capacity Development, EU, 2010.

1.8. Tool H: Analysis for the EU of the performance of key institutions

Why this tool?

The identification of key institutions (drivers of change) is not an end in itself. The important thing is to continue the analysis during the formulation of the project to understand the degree of performance of these key institutions and thus measure the level of support the project could bring to these key stakeholders once the scope of the reform has been chosen (one of the three strategies).

When and by whom can this tool be used?

This tool will be developed once the Project Identification Fiche (PIF) has been approved and should serve to feed the Action Fiche (AF).

It will concern all those who, having entered in **E1, E2 or E3**, pursue strategy 1.

For entry into **E4**, strategy 1 will also be followed if the local government is a powerful driver in the process of reform and there is proven experience in governance (among the Delegations or teams), particularly in transport, or if there is a wish to begin with a project with relatively modest objectives. In any case, the PIF will be produced quite quickly and almost jointly with the AF, since enough information is available to do so, or if the information is sufficient for the size of the envisaged project.

If a large-scale project is being considered and its chances of success are felt to be good, in the light of the past experience of the Delegation or the will of the government, preference will be given to strategy 1, as a higher qualitative and quantitative level of information will be necessary. In that case, start with this tool. Otherwise, choose strategy 2. This concerns institutional components of modest size (as part of a transport infrastructure project, for example). In this case, omit this tool and proceed directly to the next one (tool I).

The Head of Cooperation should coordinate the drafting of the AF and make sure the various sections are actually involved, especially the governance section (for its governance expertise) and infrastructure section (for its transport expertise). The Infrastructure Section is responsible for producing the tool and the AF.

How to use this tool

Tool H consists of: (1) an analytical grid of the performance of key organisations, and (2) a diagram and targeting of effective and ineffective organisations.

The **first instrument (tool H1)** is designed to evaluate the performance of each key institution via a series of key factors grouped under six axes. Each factor will be evaluated on a score ranging from 0 (poor or zero) to 4 (excellent). As far as possible, it will be determined whether

there is an improving trend, no change or deterioration in the situation of each key factor. Each axis will be scored according to the average of the scores for each key factor corresponding to it. Thus, an institution will receive seven scores: one for each of the six axes and an indicative overall score.

With the scores from each axis, the user will feed the **second tool (tool H2)**. The diagram thus obtained will give a quick idea of the performance of the institution and the location of the institutional imbalances in order to populate the Action Plan.

Context and details

The diagrams will be used to map the institutional development requirements of the key institutions for the reform strategy. Tool H is one of the sources of inspiration for the Action Plan.

How much might it cost?

This tool requires the use of external consultants to carry out surveys among a large number of stakeholders, or a survey within the organisation.

ToR are proposed in the second chapter of this volume to guide the user in his approach.

1.9. Tool I: Evaluation of the reactions of formal or informal organisations

Why this tool?

This tool goes further in the analysis of the profile of the relations between stakeholders initiated during the identification phase. It aims to analyse in detail the relations of sectoral governance and the balance (or imbalance) between the formal and informal relations in the sector in order to anticipate the reaction of the most important stakeholders when faced with change.

It simply involves listing the potential risks to reform and defining corrective actions.

When and by whom can this tool be used?

This tool will be developed once the Project Identification Fiche (PIF) has been approved and should allow the Action Fiche (AF) to be populated. It will concern all those pursuing strategy 1 or 2, irrespective of their entry point.

The Head of Cooperation should coordinate the drafting of the AF and make sure the various sections are actually involved, especially the governance and infrastructure sections. The infrastructure section is responsible for producing the tool and the AF.

How to use this tool

This instrument consists of two analytical grids: (i) one grid concerning relations of sectoral governance (tool I1) and (ii) another concerning the balance between formal and informal organisations (tool I2).

For both grids, questions on key problems should be answered. These are grouped together according to homogeneous parameters (set of mechanisms of governance etc.). The answers should highlight the possible reactions and expectations of the stakeholders faced with a possible Action Plan and will adapt the latter in the light of these two analyses.

Context and details

It is not necessary to launch a new in-depth study of the stakeholders. This tool is populated by the studies carried out during the identification phase. At most, the same consultants who analysed the political economy of the sector and the stakeholders may draft these two grids once the PIF has been approved.

How much might it cost?

Options	Manager	Execution	Budget €k	Mission person- days	Duration in weeks	Deliverable
Anticipate the reactions according to formal or informal rules of the game						
Pre-existence of sectoral support	Infrastructure Section	External	10	10	1	Report (max. 10 pages)
Emerging country	Infrastructure Section	External	10	10	1	Report (max. 15 pages)
Low-income country	Infrastructure Section	External	20	20	2	Report (max. 30 pages)

In general, it is suggested that consultants be mobilised in two steps: (i) for the drafting of the PIF and (ii) for the AF, within a single contract in order to relieve the Delegation of unnecessary intermediate procedures. Thus, the same people will be able to monitor the entire cycle of identification and formulation.

ToR are proposed in the second chapter of this volume to guide the user's approach.

Presentation of tool I

Tool I1: Analytical grid of relations of sectoral governance

Parameters to be analysed	Key problems	Analysis (mention the stakeholders)
Set of mechanisms of governance	To whom or to what do the principal agents mainly owe loyalty: superior, employer, funding agency, objective of the organisation, external agents (professional association, trade union or political party, for example)?	
	Is formal governance in clearly identified hands?	
	Are the formal mechanisms of governance stronger or weaker than the informal mechanisms?	
	Do the informal mechanisms of governance mostly complement the formal mechanisms or are the two in competition?	
Information relating to governance	Can the sector count on appropriate governance guidelines?	
	Does it benefit from the regular publication of governance guidelines, in good time?	
	Are the governance guidelines freely accessible and

Volume 2 – Toolbox

Parameters to be analysed	Key problems	Analysis (mention the stakeholders)
	opportune shared within the organisation?	
Receptivity of the function of governance	Is the stakeholder subject to predictable central decisions or to arbitrary/discretionary orders and control?	
	Are the governance guidelines in line with global formal policies?	
Implementation capacity of governance	Are the available resources and capacities sufficient from the point of view of their quantity, their quality and their response potential, to allow the agents to follow the key elements of the governance guidelines?	
	Are resource flows and their management transparent?	
Structure of the function of responsibility	Is the system of responsibility (team leaders, frequency, form and process of accountability) in line with the mechanisms of governance?	
	Do superiors apply sanctions, rewards or other measures with regard to accountability?	
Information relating to responsibility	Is the information linked to the function of responsibility freely accessible and opportune communicated to the stakeholders concerned, within and outside the public sector?	
	Is this information made available in a timely manner?	
Receptivity of the function of responsibility	Does the function of responsibility satisfy the key governance guidelines, by allowing their observance to be evaluated?	
	Does the function of responsibility take resources, processes and results into consideration in a timely manner?	
Implementation capacity of responsibility	Are the available resources and capacities sufficient to comply with the obligations of responsibility?	
	Are the resources and capacities dedicated to the exercise of responsibility appropriate in proportion to all the available resources?

Governance in the Transport Sector

Methodology and tools for integrating governance into support for the transport sector in Sub-Saharan Africa
Volume 2 – Toolbox

Tool I2: Analytical grid of the balance between formal and informal organisations

Parameter to be analysed	Key problems	Analysis (mention the stakeholders)
Balance between formal and informal organisations	Is there a broad consensus on the objectives?	
	Is the work actually carried out in accordance with official structures, or are these systematically circumvented to “get things moving”?	
	What is the balance between formal and informal channels of communication?	
	What type of network forms the basis for communication and informal exchanges?	
	What are the implicit and informal rewards and what is their weight in relation to formal rewards?	
	What balance is there between the formal and informal characters of actual management and the management functions?	
	For what purpose are the formal systems (budget, information technologies, planning, control) effectively used?	
	Are the formal systems dysfunctional? If so, how?

1.10. Tool J: Define the monitoring indicators and the logical design framework of the Action Plan

Why this tool?

The indicators must highlight governance by drawing attention to the critical factors that are evidence of good or poor performance. They can help highlight and assess the quality of governance in the transport sector. In this way, they will allow greater transparency and will be the starting point for greater responsibility.

The indicator monitoring diagram (J2) will allow their evolution over time to be monitored globally.

Finally, the logical design framework of the Action Plan (J3) summarises the envisaged actions and, by incorporating the indicators, helps draw up the future logical framework of the AF.

When and by whom can this tool be used?

This tool will be developed once the Project Identification Fiche (PIF) has been approved and should allow the Action Fiche (AF) to be completed. It concerns all those who, irrespective of their entry point, are pursuing strategy 1 or 2.

The Head of Cooperation should coordinate the drafting of the AF and make sure the various sections are actually involved. The Infrastructure Section is responsible for producing the tool and the AF.

It must allow the next tool to be developed: the monitoring fiches for actions and indicators (tool K).

How to use this tool

This tool consists of (i) a grid for producing indicators of the Action Plan (tool J1), (ii) an indicator monitoring diagram (tool J2), and (iii) a logical design framework of the Action Plan (tool J3).

The **first tool (J1)** proposes a set of 10 indicators chosen from a list of almost 200 and allocated according to their level of governance and the framework of governance. Their level of advancement or initial state must be established by means of a score from 1 (for a very bad situation) to 4 (for an excellent situation). The user will then identify the institutions that will be responsible for their production and those that must use them. Finally, each indicator must correspond to a set of activities that together will constitute the Action Plan. In this document, a series of actions is suggested that normally allow the situation to be rectified. They are not exhaustive and all will depend on the local sectoral problem.

The **second instrument** (J2) is a diagram that summarises table J1 to allow the evolution of the indicators to be monitored globally, as well as the path to be taken to proceed from the current situation to that which will be improved after the reform.

Finally, the **third tool** (J3) is a synthesis of the key information of the Action Plan which, once identified, will make it easier to draft the AF and its logical framework. This should mention the key aspects of the design of the Plan: sectoral impacts, sectoral results, sectoral capacities, the chosen objective indicators, the means of verification and targeting risks, etc.

Context and details

For the indicators to be useful, they should meet a certain number of criteria. Complex or composite indicators should be avoided, and the emphasis should be on more specific indicators that cover a wide range of the governance issues targeted. Their analysis should contribute indirectly to the taking of appropriate corrective measures.

The indicators must be transparent, available, specific and accompanied by practical arrangements. The proposed indicators are inspired by the latest document of the SSATP⁴ on the subject, published in January 2013. These 10 indicators were drawn up on the basis of criteria from which a large number of indicators have been evaluated, namely: Applicability, Credibility, Relevance, Incontestability, Comprehensiveness, Availability, Reliability and Sensitivity to Change. Besides these eight criteria, the proposed indicators were also evaluated on the basis of the equilibrium of quantity/quality, perception/reality and advance/delay.

If these ten indicators are not satisfactory, it is possible to select others that are closer to the local sectoral problem. More than 200 have been listed!

The indicators of governance were also chosen to reflect the level of governance and the framework of governance within which they evolve and overlap. The interest of the approach based on a framework and level of governance lies in the fact that each element of the framework is linked to the others. Poor performance, or improvements, in one particular area (establishment of priorities, for example) will have repercussions for another (budgetary allocation, for example); and this works both ways: good budgetary discipline may be undermined by poor programme design etc. The level of governance will indicate the scope of the indicator (and actions) in their immediate environment.

The indicators may be applied in various transport sub-sectors, or in the entire sector, or indeed at institutional level. This allows analyses to be carried out at sectoral or sub-sectoral level and comparisons to be made between countries and between regions.

⁴ *Indicators of governance in the transport sector in Sub-Saharan Africa, Working document No 95 SSATP, January 2013.*

How much might it cost?

Options	Manager	Execution	Budget €k	Mission person-days	Duration in weeks	Deliverable
Indicators of sectoral governance						
Pre-existence of sectoral support	Infrastructure Section	External	15	15	0	Report (max. 30 pages)
Emerging country	Infrastructure Section	External	20	20	0	Report (max. 30 pages)
Low-income country	Infrastructure Section	External	10	10	0	Report (max. 30 pages)

It is not necessary to launch a new in-depth study of the stakeholders. The information derives from the studies carried out during the identification phase. At most, the same consultants who analysed the political economy of the sector and the stakeholders may draft these two grids once the PIF has been approved.

In general, it is recommended that the consultants be mobilised in two steps: (i) for the drafting of the PIF and (ii) for the AF, within a single contract in order to relieve the Delegation of unnecessary intermediate procedures. Thus, the same people will be able to monitor the entire cycle of identification and formulation.

ToR are proposed in the second chapter of this volume to guide the user's approach.

• Sectoral impact		
• Sectoral result		
• Sectoral achievements / results of the reform		
• Sectoral capacities / post-reform capacity building		
• Activities of the Action Plan	• Inputs and Means	

1.11. Tool K: Monitoring of actions and indicators

Why this tool?

The aim of this tool is to enable the monitoring of the progress of reform and hence the monitoring of the Action Plan. Summary sheets will therefore be available that must be updated regularly.

When and by whom can this tool be used?

This tool is to be used in the implementation phase of the Action Plan, once the Action Fiche has been approved and the financing agreement has been signed. It will enable the progress made by the Action Plan to be monitored.

It will concern all those who have followed strategies 1 or 2. It is the perfect tool for monitoring the services of the Contracting Authority, namely those of the National Authorising Officer (NAO): COFED, CAON, BON, etc.

Within the EUD, the Infrastructure Section is responsible for managing the Action Plan and therefore for the fiches, jointly with the managers of programmes on infrastructure and modernisation of the state (among others) depending on the project for the NAO. Ideally, it will be possible to create a monitoring committee within the Delegation because of the characteristics of an institutional reform plan.

How to use this tool

The tool is relatively easy to use, and is based on common sense. A sheet will be completed for each indicator. The current level noted for the indicator in question will be indicated, along with the level defined in the objectives. The evaluations and choices must be justified for each one.

After a brief identity sheet (country, period concerned, etc.) the links with the tools of the different phases of the Action Plan cycle will be specified.

The various stakeholders and their current roles will be listed, indicating any notable changes that have occurred as a result of the project: new relationships created, defeats, conflicts, etc.

Finally, the actions of the plan that correspond to this indicator and their level of execution (in preparation, in progress or closed) will be detailed.

Context and details

Externally, the tool is intended as a means of reporting to a steering committee and/or the transport (or governance or public finance management) sector group. In this case, the EU is the leader in external support for reform between the DPs.

How much might it cost?

It is not planned to use consultants.

Presentation of tool K

INDICATOR 1	CLARITY AND DISTINCTION IN THE RESPONSIBILITIES OF THE PRINCIPAL MINISTRIES, DEPARTMENTS AND BODIES OF THE TRANSPORT SECTOR
CURRENT LEVEL	1
Justification of current level:	
OBJECTIVE in (X years)	2
Justification of the objective:

2. Standard terms of reference

This annex aims to assist users of this document who are helping draft ToR for the studies required to develop the various tools. They are only relevant to the hiring of external consultants and not to research carried out internally.

The proposed ToR are meant to be adaptable for each stage of the set of tools (for all strategies). At no point does this annex present final ToR or a series of ToR for each tool (which would be pointless). The user in a Delegation is free to amend them according to the local context encountered, their experience, etc.

It is possible to carry out the studies in separate blocks, for example under several framework contracts and therefore with separate ToR, based on this model and distinct teams of consultants. It is also possible to establish successive blocks: a single framework contract, but with specific tranches to retain continuity within the team, if the budget does not reach the limit fixed by the framework contracts.

Several options are available between the two. It is up to the Delegation, depending on the means and preferences of the team responsible. However, the authors of this document recommend a stage-by-stage approach depending on the project cycle: (1) programming and/or definition of the strategy (for entry into E1 and E2), (2) studies to help with the formulation of the PIF, and (3) studies to help with the formulation of the Action Fiche and with monitoring the actions.

Finally, these ToR do not deal with tasks involved in the usual design of a project or a community support programme for governance in the transport sector (drafting of the PIF and the Action Fiche, including ATPs), although these tasks could easily be included, if necessary. In this case, the same team of consultants would produce the tools and documents required by the cycle of projects of the EU. This would give more consistency to the content of the project and deliver certain economies of scale.

Chapter 1 of the ToR: Study context

All participants in the process must have an idea of the events and situations that have led to the formulation of the ToR. The first chapter of the ToR can **briefly** address the following issues:

- Main reasons why the study is necessary;
- Brief general information on the sector, the key organisations and stakeholders. Where applicable, recent studies can also be mentioned;
- Brief description of the overall process;
- Justification of the selection of key organisations. The chosen organisations must be essential to the supply of services/products that the established action plan aims to offer. If the range of organisations can be modified as the evaluation process progresses, this should be specified;
- Brief description of the key stakeholders;
- Role of the National Authorising Officer and his/her teams;
- Brief description of the process behind the ToR: who took the initiative? Who drafted the ToR? Based on what consultations and/or joint dialogue and works? Who approved and endorsed them? Who will finance the process?

Chapter 2 of the ToR: General organisation of the study

Poorly defined roles can too easily impair the effectiveness of responsibility, governance and the transparency of the process. Very often, the ToR do not clearly specify who is the contracting authority or the responsible authority and therefore do not identify to whom the team responsible for its implementation should refer.

Chapter 3 of the ToR: Objectives of the study

What actions will follow from the results of the study? The objectives describe what those responsible intend doing. How will those responsible use the results of the process? For what strategic decisions and for what tactical/operational decisions will that serve as a basis?

Do not confuse objectives with activities. Precise, uncomplicated objectives should be chosen.

To simplify, it is worth setting a general objective and a specific objective for each tool, taking the expected objective for each tool from the tool sheets of this document. If the PIF and the Action Fiche require drafting, this must be specified at this level, with a specific objective for each document, for example.

Chapter 4 of the ToR: The anticipated results of the study

This section describes the specific results to be obtained by those implementing the study. These results are necessary but generally insufficient in themselves to achieve the objectives. All too often it is felt, for example, that the result would simply be a report with the tools.

Often, however, several other intermediate actions must be taken into account and detailed, namely:

- Workshops with the stakeholders,
- Launch and feedback meetings in situ and/or in Brussels,
- Coordination meetings with the contracting authority and the prime contractor,
- Intermediate report,
- A final report (indicating maximum length and, where appropriate, annexes) with a distribution list,
- Digital versions of the final reports and annexes, also with distribution lists.

If the PIF and the Action Fiche are integral components of the study objectives, this should be specified, adding the intermediate results envisaged.

In all cases, the degree of confidentiality of the study (or part of it only) must be defined, particularly during the programming and definition phases of the strategy.

Chapter 5 of the ToR: Content and scope of the study

This section of the ToR presents the information that will be collected on the basis of the tools concerned. In the toolbox of chapter 5, the user will find sheets for each tool from where they can take the information required to draft this chapter.

At this level, it is worth describing what information is to be collected for each tool. For each tool, this chapter will explain how to process this information.

The tools presented in this document (or as amended by the Delegation) will be annexed to the ToR.

Chapter 6 of the ToR: Methodology and approach of the study

The methodology and approach section will explain how the study proposes (i) engaging with stakeholders and other actors, (ii) collecting data and the sources to be used and (iii) to subdivide the process into an activity programme.

Essentially, this chapter should describe the degree of participation envisaged in the process and the roles of the stakeholders. Do not omit possible institutional points of conflict that might exist.

For the process to have a chance of success, contracting authorities and prime contractors of the study will obviously have to devote time to it.

The people and bodies concerned must be described precisely. This can be carried out in the field and in the consultant's home office. The amount of time represented by interviews should be specified (avoid too many interviews or overly long meetings), etc.

The methods and tools for collecting data must be broadly outlined, in particular: literature search (indicate the list of available documents), Internet (list of available sites), type and number of surveys, working meetings, SWOT-type workshops (or other participatory approaches, if required), individual or group interviews, etc.

Provide an organisational chart showing the proposed activity programme and the expected deliverables (reports etc.). The programme should show the documentary phases in situ or with the consultants (if necessary), the drafting phases (in situ or not), etc. Define the main stages of the studies (programming, identification, formulation, for example).

Chapter 7 of the ToR: Roles and responsibilities in the study

This section describes the framework for the management and execution of the study by providing the implementation team with a clear operational framework and by specifying the main tasks to be carried out by others.

This may involve defining the following tasks:

The relations between the team of consultants and the contracting authorities and prime contractors (including the means of communication between the parties),

Who will be responsible for providing the team with documentation,

Team management roles,

To whom the team should refer for particularly important matters, and how,

How and by whom meetings with the team will be managed and by whom; how participatory events will be organised;

Whether logistical support will be provided for the team, and how.

An interview schedule should be drafted at the start of the field mission and be updated during the mission.

Chapter 8 of the ToR: Profiles and qualifications of the consultants

The content of this section depends on the objective and scope of the study. It describes the required qualifications for the team, which may consist of one or more people (see the tool sheets in chapter 5).

The detailed description of the team should specify the number of team members, their positions (team leader, transport economist etc.) and the qualifications and experience, etc required.

For each tool, the profiles of the consultants are described as part of the tool. Depending on the number of tools involved and their sequence during the study, it will therefore simply be a matter of adding together the profiles (transport engineer, transport economist, governance expert, etc.), nothing more. Given the complexity of the subject (which requires a certain level of knowledge), it is not recommended that junior experts be used. Preference should be given to senior profiles.

Chapter 9 of the ToR: Duration and timetable of the study

This section indicates the time (in working days) devoted to each study stage.

The programme should allow sufficient time for the following activities:

- (i) **Preparation of the mission:** mobilisation of team members, familiarisation with documents, etc.,
- (ii) **Field and/or office:** time needed to achieve the results and objective of the study, distribute deliverables, field visits etc.,
- (iii) **Reporting:** final dates for the draft and final reports, lists of all recipients for each report and procedures for processing comments.

It is worth checking the availability of both individuals and documents that are important to the study.

In the same way as for the previous chapter, reference should be made to the estimate made for each tool in chapter 5, depending on the profile of the country. The number of working days can be reduced depending on the number of tools required.

Finally, the **provisional budget** may be obtained by adding together the estimated budgets for each tool. As for the number of days, it is possible to envisage economies of scale depending on the volume of tools to be produced, the method of programming activities, etc.
