

# Introduction to community mapping and Participatory GIS

Objectives, Aims, Feedback

**Dr. Stefan KIENBERGER<sup>1</sup>**

<sup>1</sup> Centre for Geoinformatics – Salzburg University, Austria

# ***The question of „where“***

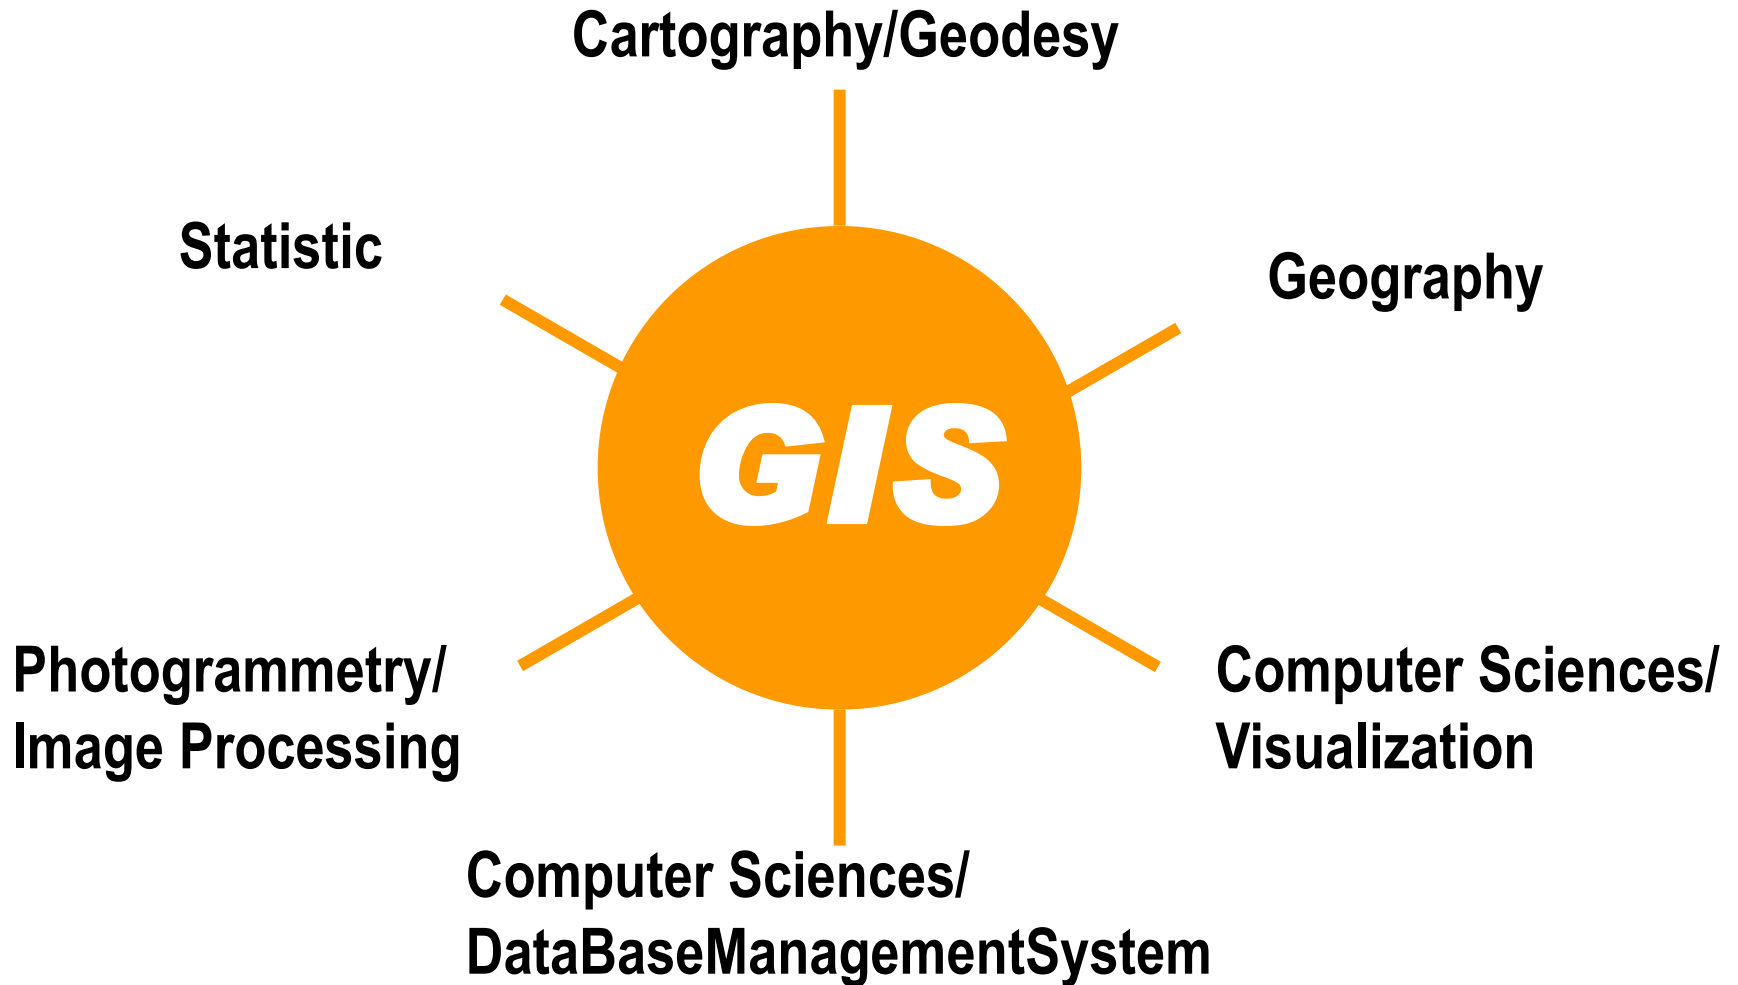

**Almost everything that happens, happens  
SOMEWHERE**

**Knowing WHERE something happens is critically  
IMPORTANT**

**“... over 80% of the information in world-wide  
use is related to space.”**

# ***Definition of GIS***

!!! There are many !!!

# Definition of GIS

"A GIS is a computer system designed to allow users to *collect, manage, and analyze* large volumes of *spatially referenced and associated attribute data*." [Hemenway 1989]

A GIS is "a powerful *set of tools* for *collecting, storing, retrieving at will, transforming, and displaying spatial data from the real world*" [Burrough & McDonell, 1998]

"A spatial *decision support system*" [David Cowen]

"A system of *hardware, software, data, people, organizations and institutional arrangements* for *collecting, storing, analyzing, and disseminating information* about areas of the earth." [Dueker & Kjerne, 1989]

"a computer based system for the *capture, storage, retrieval, analysis and display of spatial data*" [Clarke, 1986]

"... a system which uses a *spatial database* to provide *answers to queries of a geographical nature*."... " Since putting spatial data into a computer at great expense for the sole purpose of getting it out again would be pointless, a GIS must allow a *variety of manipulations* to be carried out, such as *sorting, selective retrieval, calculation and spatial analysis and modeling*. We also expect a full range of functions to allow input of data in map form, and *cartographic output* ..." [Goodchild, 1985]

# Definition of GIS

## ■ A GIS **is**:

- ... a computer based system
- ... based on explicit spatially referenced data
- ... combination of different working procedures
- A GIS strongly supports the administration and analysis of spatial data

## ■ A GIS **is NOT**:

- ONLY maps
- ONLY a spatial database
- Not every „Information System“ with spatial data is a GIS

# ***Components of a GIS***

# ***Components of a GIS***

- **Hardware**

- Fast development in the last years, PCs; GPS, Digitizing board, Scanner, Printer, Potter, Internet Connection, Network

- **Software**

- Different Software companies (e.g. ESRI, ERDAS, Intergraph, Idrisi, Smallworld); significant development of Open Source GIS products (e.g. GRASS)

- **Georeferenced Data**

- „Data is the rocket fuel of GIS, the elixir of life for a box of tools“
- Spatial Object → Attributes + spatial orientation (see later)

- **Organisation**

- GIS within institutional structures embedded
- Tasks:
  - Administration/Organisation/Acquisition of Data
  - Meta-Information of data basis in the context of the referenced area
  - Development of applications
  - Qualifications of personnel

# ***A short history of GIS***

**1963** → Canadian Geographic Information System is developed (CGIS), „Birth“ of GIS

**1964** → Harvard Lab (USA) is established

## **Era of Innovation**

**1969** → Jack Dangermond (Student Harvard Lab) form the Environmental Systems Research Institute

**1972** → Landsat 1 launched

---

**1981** → ArcInfo launched

**1985** → GPS operational

**1987** → First Journal on GIS (International Journal of Geographic Information Science)

**1994** → Open GIS Consortium born

## **Era of Commercialization**

**1996** → Internet GIS products introduced

---

**> 2000** → GIS has 1 million of core users; going Mainstream

## **Era of Exploitation**

# *History of ,participation‘*

- **Mid1980s**

- **four decades** of development cooperation **did not lead to a sustained improvement**
- infrastructure was “**imposed on**” the Countries of the South
  - **Without** considering the **cultural and social environment**
- **Cognition** → active participation of the stakeholders as a core condition for successful and sustainable development

- **> 1990s**

- core issue within the field of development cooperation
- used by NGOs and development agencies (GTZ, USAID, World Bank, FAO,...)
- → **BUZZWORD ?!**

# **Defining Participation and PGIS**

*"Participatory development stands for **partnership** which is built upon the **basis of dialogue** among the various actors, during which the agenda is jointly set, and **local views and indigenous knowledge** are deliberately sought and respected. This implies **negotiation** rather than the dominance of an externally set project agenda. Thus **people become actors** instead of being beneficiaries" [UNDP 1998]"*

# ***Defining Participation and PGIS***

- **not a common understanding** of participation (also within organisations)
- **Instrument** OR **goal**
- **Pseudo-participation** OR **Empowerment**

# ***Difference between North and South***

- **PGIS in the North**

- Urban neighbourhood identification
- Problem prioritisation
- Participatory learning
- ...

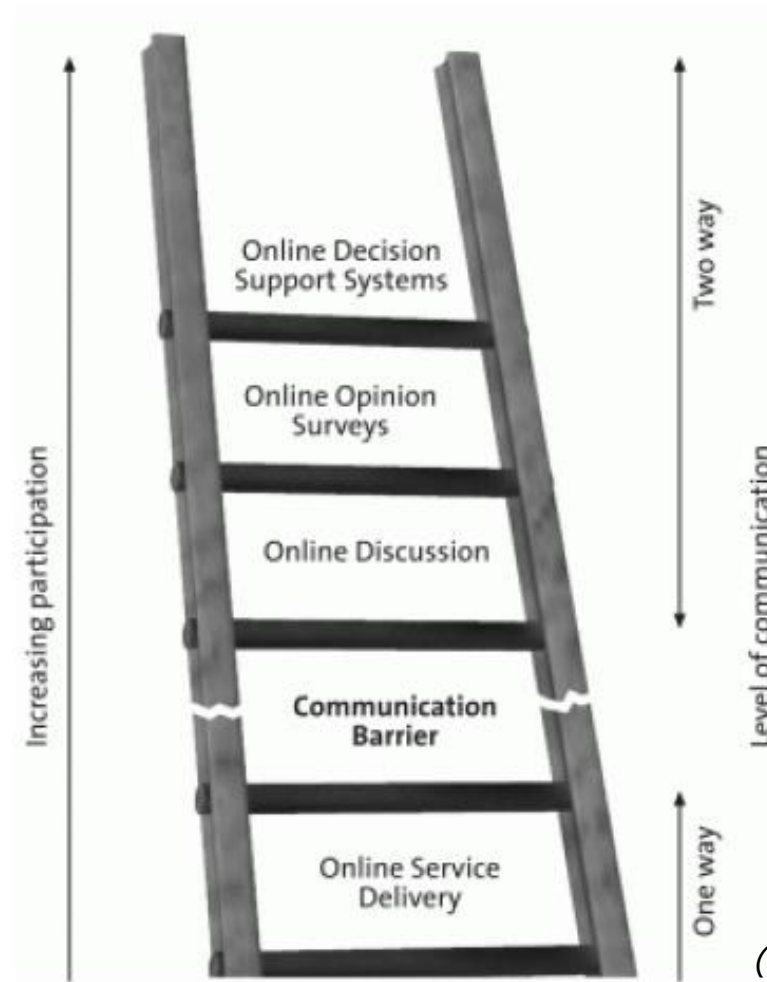

- **PGIS in the South**

- Natural resource identification and management
- Environmental hazard mapping
- ...

- **PGIS and Indigenous**

- legitimising customary land and resource claims
- ...

# ***e-participation ladder***

(Steinmann et al 2004)

# ***Roots PGIS (,South‘)***

- Spontaneous merger of **Participatory Learning and Action (PLA)** and methods of **GIS**
- **Represent people's spatial knowledge** in the forms of **virtual or physical maps** (2D/3D)
- Making **GIT&S available to disadvantaged groups in society** → generating, managing, analysing, communicating spatial information

*(Rambaldi et al 2006)*

# ***Tools, methods, technologies***

- **Ephemeral maps**
- **Sketch mapping**
- **Scale mapping**
- **PGIS spatial analysis**
- **Participatory 3-Dimensional Modelling**
- **Photomaps**
- **Mobile devices (PDA and GPS)**

*(Rambaldi et al 2006)*

# Examples - South

# *Questions to be addressed*

- **Whose GIS** is it?
- **Whose questions** are addressed?
- Who **sets the agenda**?
- What will happen **when the experts leave** or donor funding dries up?
- What is left with those **generated the data and shared the knowledge**?

*(Rambaldi et al 2006)*

# *Differences between North and South*

- **PGIS in emerging countries**

- “an attempt to utilise GIS technology in the **context of the needs and capabilities of communities** that will be **involved** with, and **affected** by **development projects** and **programmes**”. [Abbot 1998]

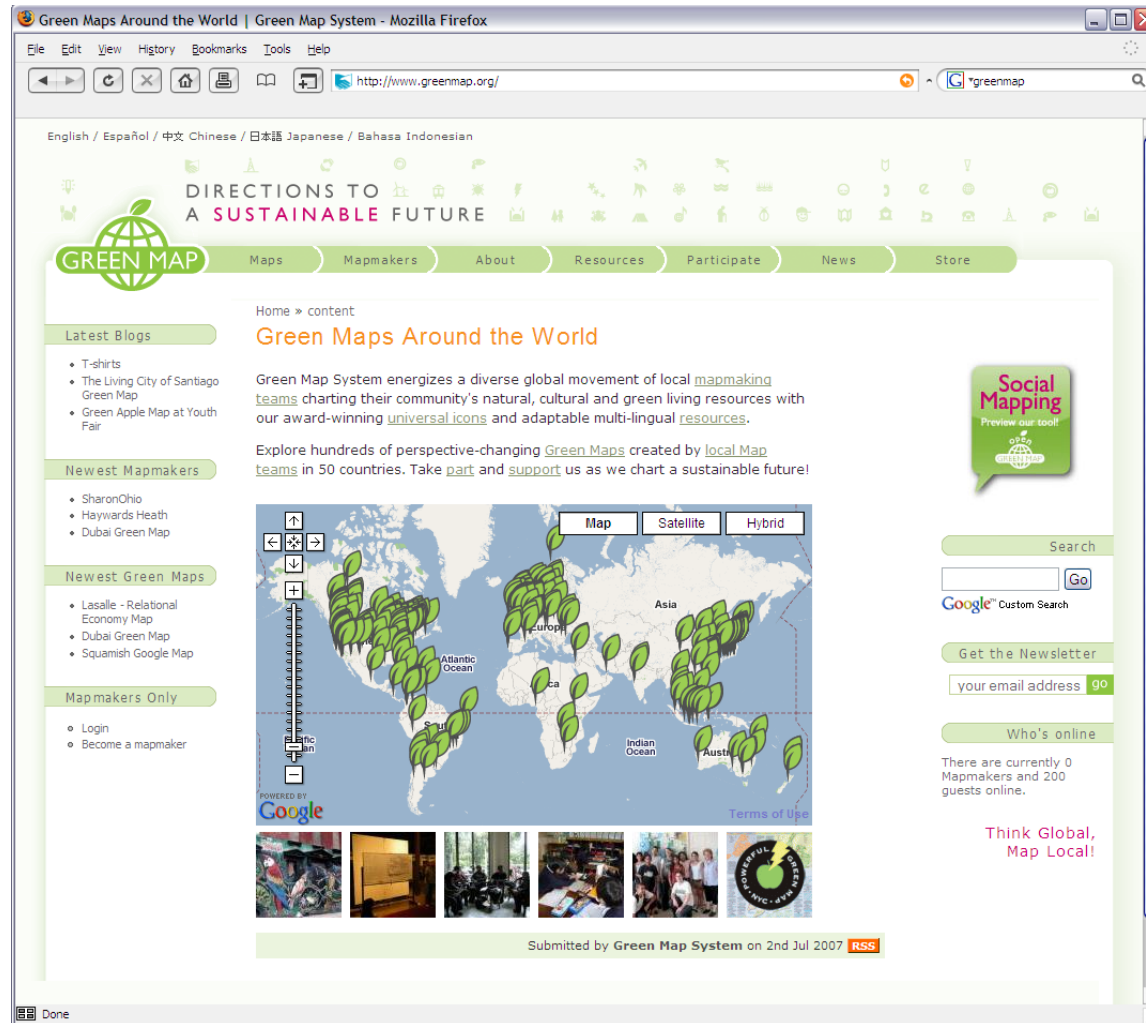

- **Presently**

- **Not a common definition for PGIS**
- **Confusion of terms** (PPGIS, PGIS, CiGIS, P-Mapping...)
- But **improvements** made in recent years...
- **Different communities** (North & South)

- **Applied**

- Community Mapping, Decision Making (Communities), Baseline Data Acquisition...

# Examples - North

TT84 System	Specs	Benefits
<p>The TouchTable TT84 is a large group collaboration system for visualization, navigation and analysis of data. Functioning as both presentation and input device, the TT84 displays data on the table surface where it can be manipulated using hand gestures. The touch and pressure-enabled interface, large display size and form factor of the TT84 allow users to gather around the table to participate in group discussions.</p> <p>TouchTables aid in decision making by replacing the traditional classroom style lecture environment with a shared group experience. When gathered around the table, everyone in the group has equal access to the displayed information and menu system allowing control of the discussion to flow naturally. This shared experience increases each participants understanding resulting in faster, more</p>	<ul style="list-style-type: none"><li>• 67" x 50" (84" diagonal) horizontal projection surface</li><li>• Matte-white, powder-coated, aluminum surface</li><li>• True UXGA (1600x1200) native resolution &amp; 7700 ANSI Lumens</li><li>• 3" square steel tubing base with stainless steel levelers</li><li>• Industrial connections for power and computer connections</li><li>• Two 45" vertical, touch-surround displays with stands</li></ul>	<ul style="list-style-type: none"><li>• Data can be accessed, manipulated and shared quickly and easily.</li><li>• System form factor facilitates large group discussion and collaboration.</li><li>• Geographically separated teams can visualize, discuss and share ideas in real-time.</li><li>• Large display surface allows more data to be viewed at once, increasing the amount of information available for analysis.</li></ul>

# ***PGIS and disaster risk reduction***

- **Currently also more emphasis on community-based disaster risk management programs**
  - vulnerable people themselves will be involved in planning and implementing disaster risk management measures along with local, provincial, and national entities through partnership
- **Different methodologies**
  - de Dios 2002 (Oxfam), ADPC 2004, Action Aid 2005
- **But only a few publications available**
  - Contrary to the fact that one of the typical application fields of PGIS is Disaster Risk Reduction
    - still lacking evidence of the efficiency and effectiveness of PGIS practice in regard to disaster risk reduction.

# ***Link hazard and poverty***

The occurrence of **natural disasters** is based on the convergence of two major factors:

- **Hazard**
- **Vulnerability**
- It might seem self-evident that disasters have a **greater impact on poorer countries**
- It is important to **understand how poverty and the impact of disasters** are linked!

# ***Link hazard and poverty***

(Source: EM-DATA)

- **Poor population often end up:**
  - living in high risk / environmentally degraded areas,
  - having the least access to social safety nets or infrastructure,
  - having a few savings or available credits.
  
- **Problem context of migration and urbanisation**

## Brainstorming (groups of two):

What do you think are the

- **benefits**
- **challenges**

in working with **participatory approaches** (e.g. community mapping) in **Malawi** in regard to **disaster risk reduction**?
