VCA4D against inequalities. Measure and understand to inform and act!

VCA4D presents a project lab to discuss insights on inequalities within agricultural value chains (VCs) across Africa presenting the perspectives of researchers and policy makers. VCs can yield both positive and negative effects on economic growth and inclusiveness.

The panel will present and discuss three case studies (Aquaculture and Egg in Zambia and Green Beans in Kenya) to highlight the relevance of the VCA4D approach to:

- **Measure** quantitative/evidence based indicators that can inform on inequalities;
- **Understand** and appraise inequalities through a multidisciplinary diagnosis within a VC;
- **Inform** policy makers and stakeholders to support efforts in increasing equality.

The VCA4D methodology analyses the extent to which VCs are inclusive and economically, socially and environmentally sustainable across several EU partner countries.

VCA4D is a project funded by the
European Union and implemented by [Agrimatura](#).
