Application
to climate
change

Conclusions

Our starting point

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Economic evaluation of climate policy has become mired in a debate about appropriate time and risk preferences

Our starting point

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Economic evaluation of climate policy has become mired in a debate about appropriate time and risk preferences
 - e.g. 'Stern versus Nordhaus'

Our starting point

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Economic evaluation of climate policy has become mired in a debate about appropriate time and risk preferences
 - e.g. 'Stern versus Nordhaus'
- There is no immediate prospect of universal agreement on the specification of time and risk preferences

Our starting point

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Economic evaluation of climate policy has become mired in a debate about appropriate time and risk preferences
 - e.g. 'Stern versus Nordhaus'
- There is no immediate prospect of universal agreement on the specification of time and risk preferences
 - \approx incomplete information about the discount and utility functions

Our starting point

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Economic evaluation of climate policy has become mired in a debate about appropriate time and risk preferences
 - e.g. 'Stern versus Nordhaus'
- There is no immediate prospect of universal agreement on the specification of time and risk preferences
 - \approx incomplete information about the discount and utility functions
- Could we nonetheless still find *spaces for agreement* on which investment to choose?

Our starting point

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Economic evaluation of climate policy has become mired in a debate about appropriate time and risk preferences
 - e.g. 'Stern versus Nordhaus'
- There is no immediate prospect of universal agreement on the specification of time and risk preferences
 - \approx incomplete information about the discount and utility functions
- Could we nonetheless still find *spaces for agreement* on which investment to choose?
 - Assuming agreement only extends to partially specifying time and risk preferences, spaces for agreement \equiv partial orderings

Theory

Application
to climate
change

Conclusions

- Some of the theoretical machinery we require already exists
 - Stochastic Dominance (Fishburn, 1964,...) and 'Almost' Stochastic Dominance (Leshno and Levy, 2002, and Tzeng et al., 2012, in *Mgt. Sci.*)
 - Time Dominance (Bøhren and Hansen, 1980 in *Scand. J. Econ.*; Ekern, 1981, in *J. Finance*)
- But...
 - ...Stochastic Dominance is essentially an a-temporal framework

Unifying stochastic dominance and time dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Some of the theoretical machinery we require already exists
 - Stochastic Dominance (Fishburn, 1964,...) and 'Almost' Stochastic Dominance (Leshno and Levy, 2002, and Tzeng et al., 2012, in *Mgt. Sci.*)
 - Time Dominance (Bøhren and Hansen, 1980 in *Scand. J. Econ.*; Ekern, 1981, in *J. Finance*)
- But...
 - ...Stochastic Dominance is essentially an a-temporal framework
 - Time Dominance considers cashflows that are known with certainty

Unifying stochastic dominance and time dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- Some of the theoretical machinery we require already exists
 - Stochastic Dominance (Fishburn, 1964,...) and ‘Almost’ Stochastic Dominance (Leshno and Levy, 2002, and Tzeng et al., 2012, in *Mgt. Sci.*)
 - Time Dominance (Bøhren and Hansen, 1980 in *Scand. J. Econ.*; Ekern, 1981, in *J. Finance*)
- But...
 - ...Stochastic Dominance is essentially an a-temporal framework
 - Time Dominance considers cashflows that are known with certainty
- Therefore the conceptual task is to unify the approaches, yielding a theory of *Time-Stochastic Dominance (TSD)*

An application to climate change

Application
to climate
change

Conclusions

- We compare trajectories for global greenhouse gas emissions

An application to climate change

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We compare trajectories for global greenhouse gas emissions
 - Our policies limit the atmospheric stock of CO₂ to various levels, plus 'business as usual'

An application to climate change

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We compare trajectories for global greenhouse gas emissions
 - Our policies limit the atmospheric stock of CO₂ to various levels, plus 'business as usual'
- We use a version of the DICE integrated assessment model (Nordhaus) to estimate the effect of these policies on consumption

An application to climate change

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We compare trajectories for global greenhouse gas emissions
 - Our policies limit the atmospheric stock of CO₂ to various levels, plus 'business as usual'
- We use a version of the DICE integrated assessment model (Nordhaus) to estimate the effect of these policies on consumption
 - Unlike standard DICE our version is stochastic, with eight random parameters

An application to climate change

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We compare trajectories for global greenhouse gas emissions
 - Our policies limit the atmospheric stock of CO₂ to various levels, plus 'business as usual'
- We use a version of the DICE integrated assessment model (Nordhaus) to estimate the effect of these policies on consumption
 - Unlike standard DICE our version is stochastic, with eight random parameters
- While we are unable to find standard time-stochastic dominance in the data, we find that the toughest emissions targets 'almost' dominate their weaker counterparts

An application to climate change

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We compare trajectories for global greenhouse gas emissions
 - Our policies limit the atmospheric stock of CO_2 to various levels, plus 'business as usual'
- We use a version of the DICE integrated assessment model (Nordhaus) to estimate the effect of these policies on consumption
 - Unlike standard DICE our version is stochastic, with eight random parameters
- While we are unable to find standard time-stochastic dominance in the data, we find that the toughest emissions targets 'almost' dominate their weaker counterparts
 - We can say that only those with 'extreme' preferences would not opt to cut emissions by a large amount

Spaces for agreement

Space for

Introduction

Theory

Application
to climate
change

Conclusions

An intuition for the theory

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We seek to establish dominance relations by looking at differences between cumulative distributions

An intuition for the theory

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We seek to establish dominance relations by looking at differences between cumulative distributions
 - In Stochastic Dominance these are *cdfs*, i.e.
$$D^j(z) = G^j(y) - F^j(x)$$

An intuition for the theory

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We seek to establish dominance relations by looking at differences between cumulative distributions
 - In Stochastic Dominance these are *cdfs*, i.e.
$$D^j(z) = G^j(y) - F^j(x)$$
 - In Time Dominance these are cumulative cashflows, i.e.
$$Z_i(t) = X_i(t) - Y_i(t)$$

An intuition for the theory

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We seek to establish dominance relations by looking at differences between cumulative distributions
 - In Stochastic Dominance these are *cdfs*, i.e.
$$D^j(z) = G^j(y) - F^j(x)$$
 - In Time Dominance these are cumulative cashflows, i.e.
$$Z_i(t) = X_i(t) - Y_i(t)$$
 - In Time-Stochastic Dominance these are *cdfs* of cashflows, i.e. $D_i^j(z, t) = G_i^j(y, t) - F_i^j(x, t)$

An intuition for the theory

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- We seek to establish dominance relations by looking at differences between cumulative distributions
 - In Stochastic Dominance these are *cdfs*, i.e.
$$D^j(z) = G^j(y) - F^j(x)$$
 - In Time Dominance these are cumulative cashflows, i.e.
$$Z_i(t) = X_i(t) - Y_i(t)$$
 - In Time-Stochastic Dominance these are *cdfs* of cashflows, i.e. $D_i^j(z, t) = G_i^j(y, t) - F_i^j(x, t)$
- The order of dominance is the number of times the distribution is cumulated/integrated

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Theory

Application
to climate
change

Conclusions

- The trouble is dominance can be very hard to demonstrate

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- The trouble is dominance can be very hard to demonstrate
- A classic example is that (simple, i.e. a-temporal) stochastic dominance cannot rank the following alternatives

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- The trouble is dominance can be very hard to demonstrate
- A classic example is that (simple, i.e. a-temporal) stochastic dominance cannot rank the following alternatives
 - 1 F pays out \$0.5 with probability 0.01 and \$1 million with probability 0.99
 - 2 G pays out \$1 for sure

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- The trouble is dominance can be very hard to demonstrate
- A classic example is that (simple, i.e. a-temporal) stochastic dominance cannot rank the following alternatives
 - 1 F pays out \$0.5 with probability 0.01 and \$1 million with probability 0.99
 - 2 G pays out \$1 for sure
- Why? $D^j(z) = G^j(y) - F^j(x) < 0, \forall j, x, y \in [0.5, 1)$

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- The trouble is dominance can be very hard to demonstrate
- A classic example is that (simple, i.e. a-temporal) stochastic dominance cannot rank the following alternatives
 - 1 F pays out \$0.5 with probability 0.01 and \$1 million with probability 0.99
 - 2 G pays out \$1 for sure
- Why? $D^j(z) = G^j(y) - F^j(x) < 0, \forall j, x, y \in [0.5, 1)$
- Intuition: broad classes of preferences include extreme risk aversion

Almost Time-Stochastic Dominance

change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- To deal with this we extend the approach of 'Almost' Stochastic Dominance
- According to this approach:

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- To deal with this we extend the approach of 'Almost' Stochastic Dominance
- According to this approach:
 - Measure the area/volume of violation of dominance, relative to the total area/volume between the distributions

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- To deal with this we extend the approach of 'Almost' Stochastic Dominance
- According to this approach:
 - Measure the area/volume of violation of dominance, relative to the total area/volume between the distributions
 - Link this violation measure with a restriction on preferences, i.e. functions admissible in $V_i \times U_j$

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- To deal with this we extend the approach of 'Almost' Stochastic Dominance
- According to this approach:
 - Measure the area/volume of violation of dominance, relative to the total area/volume between the distributions
 - Link this violation measure with a restriction on preferences, i.e. functions admissible in $V_i \times U_j$
- Violation is between 0 and 0.5

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- To deal with this we extend the approach of 'Almost' Stochastic Dominance
- According to this approach:
 - Measure the area/volume of violation of dominance, relative to the total area/volume between the distributions
 - Link this violation measure with a restriction on preferences, i.e. functions admissible in $V_i \times U_j$
- Violation is between 0 and 0.5
 - Close to zero: small violation and few functions are thrown out, hence large space for agreement

Almost Time-Stochastic Dominance

Space for
agreement
on climate
change?

Dietz &
Matei

Introduction

Theory

Application
to climate
change

Conclusions

- To deal with this we extend the approach of 'Almost' Stochastic Dominance
- According to this approach:
 - Measure the area/volume of violation of dominance, relative to the total area/volume between the distributions
 - Link this violation measure with a restriction on preferences, i.e. functions admissible in $V_i \times U_j$
- Violation is between 0 and 0.5
 - Close to zero: small violation and few functions are thrown out, hence large space for agreement
 - Close to 0.5: large violation and many functions are thrown out, hence small space for agreement

Introduction

Theory

Application
to climate
change

Conclusions

- We do not find standard TSD between any of our policies
- We look instead for Almost TSD, and find it, i.e. we find very small violations of strict TSD
- We can give the violations an interpretation in terms of the decision-maker's utility and discount functions
 - We use this to argue that only those with 'extreme' preferences would prefer weaker to tougher emissions targets in our set
 - Another way of looking at this is that the debate about time and risk preferences may not be so important after all
